Version History

Version 1.0

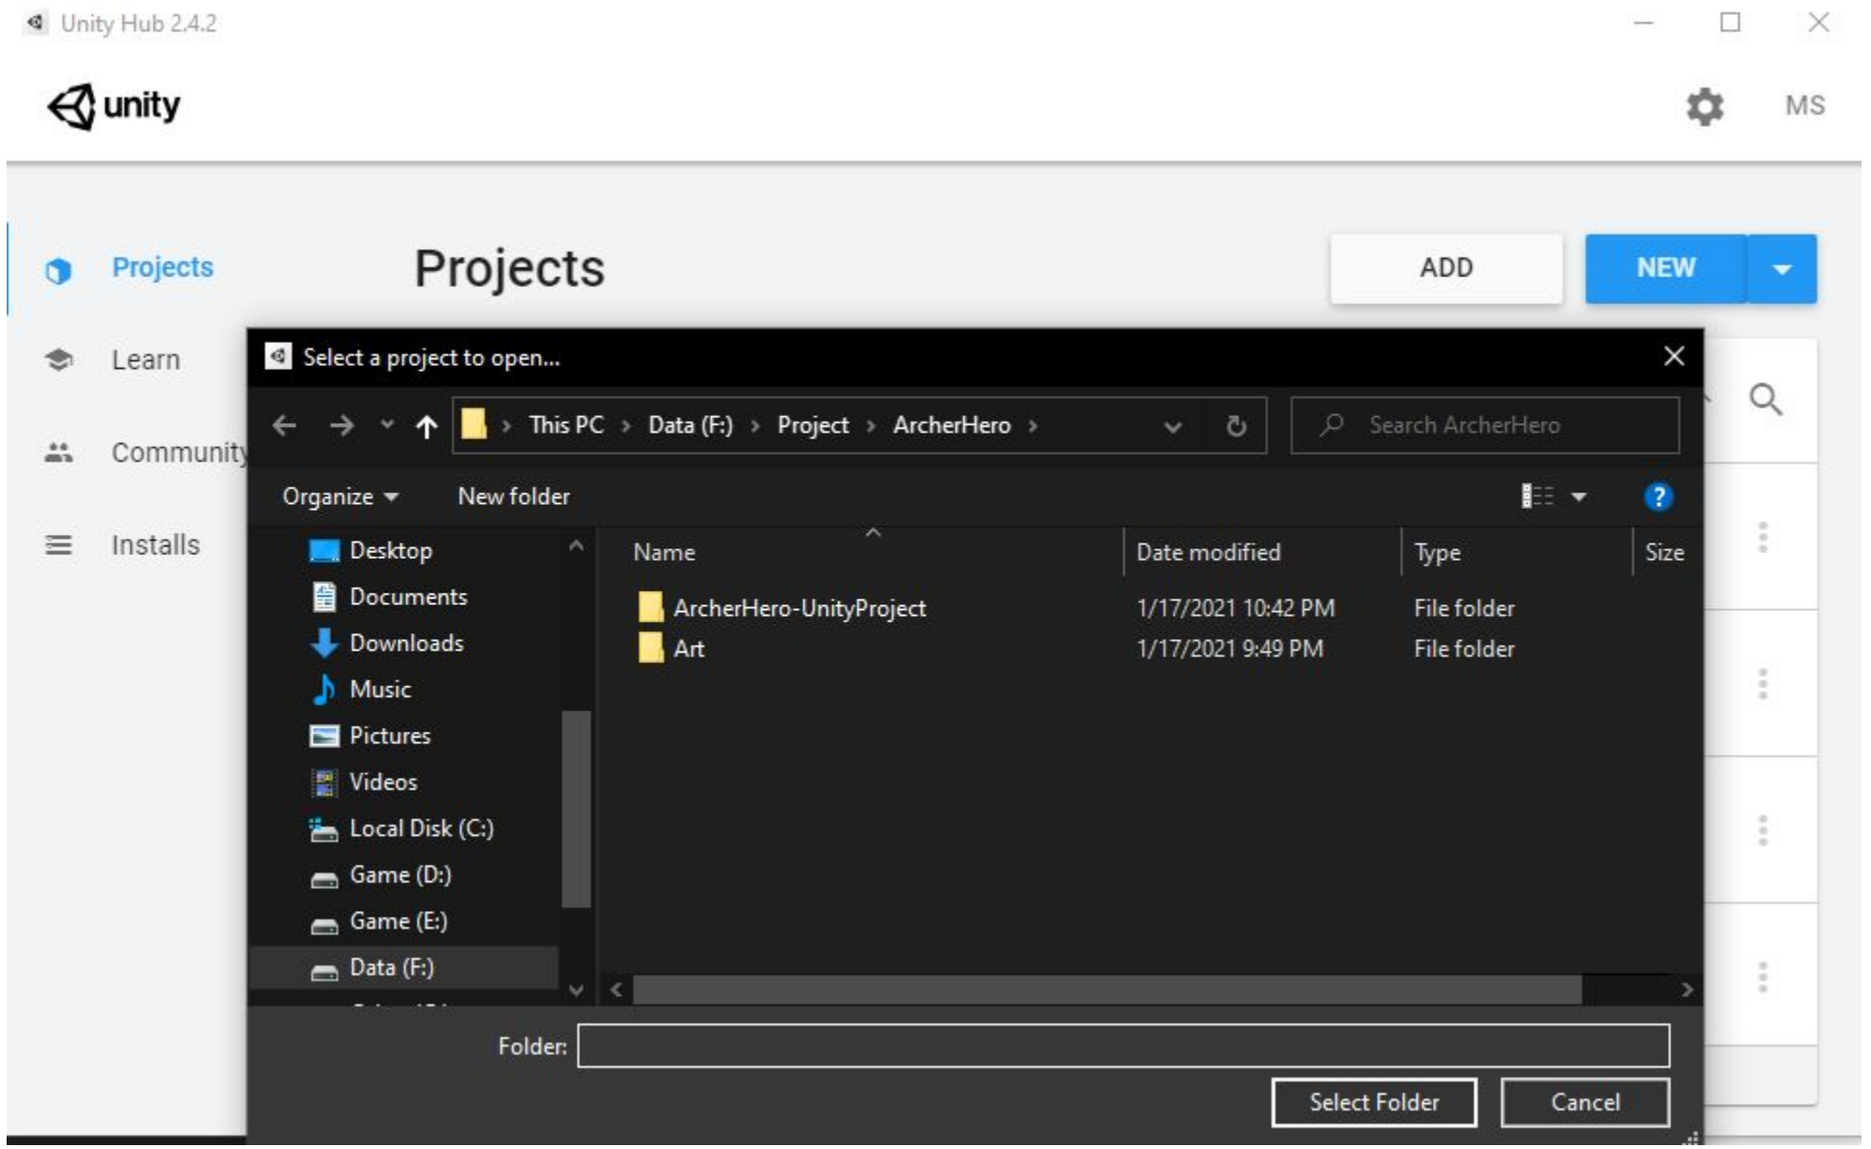

- Initial release.

Requirements

Unity 3D version 2019.3.9f1 or higher.

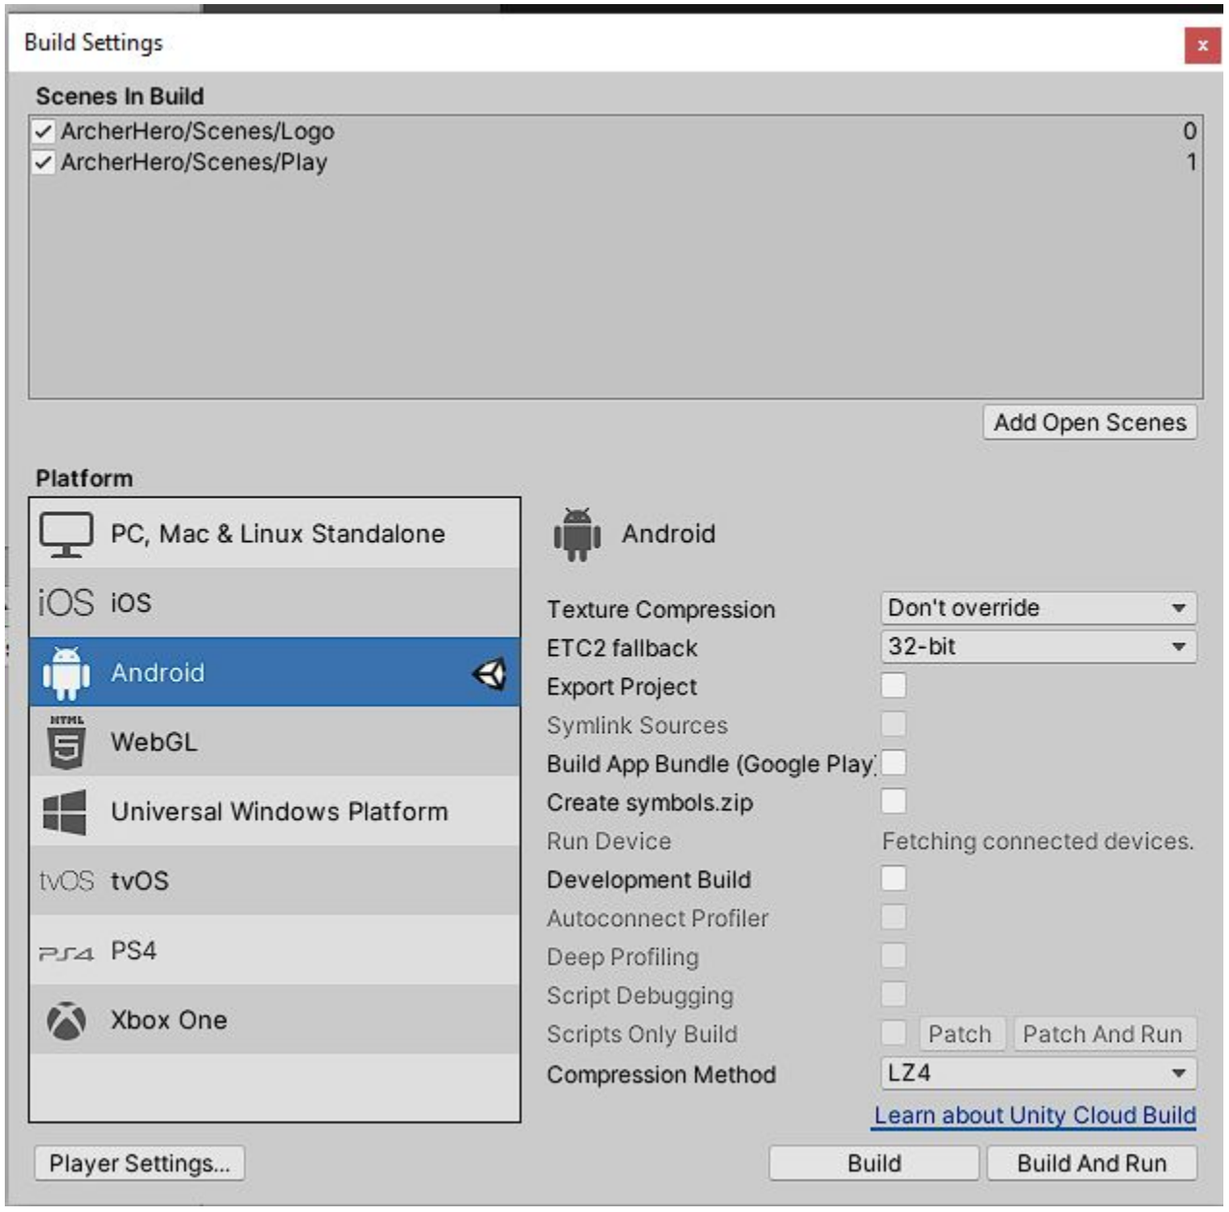

How to Open the Project

Install [Unity Hub] and add the project in Unity Hub like the image below. Then click on the project name to open the project.

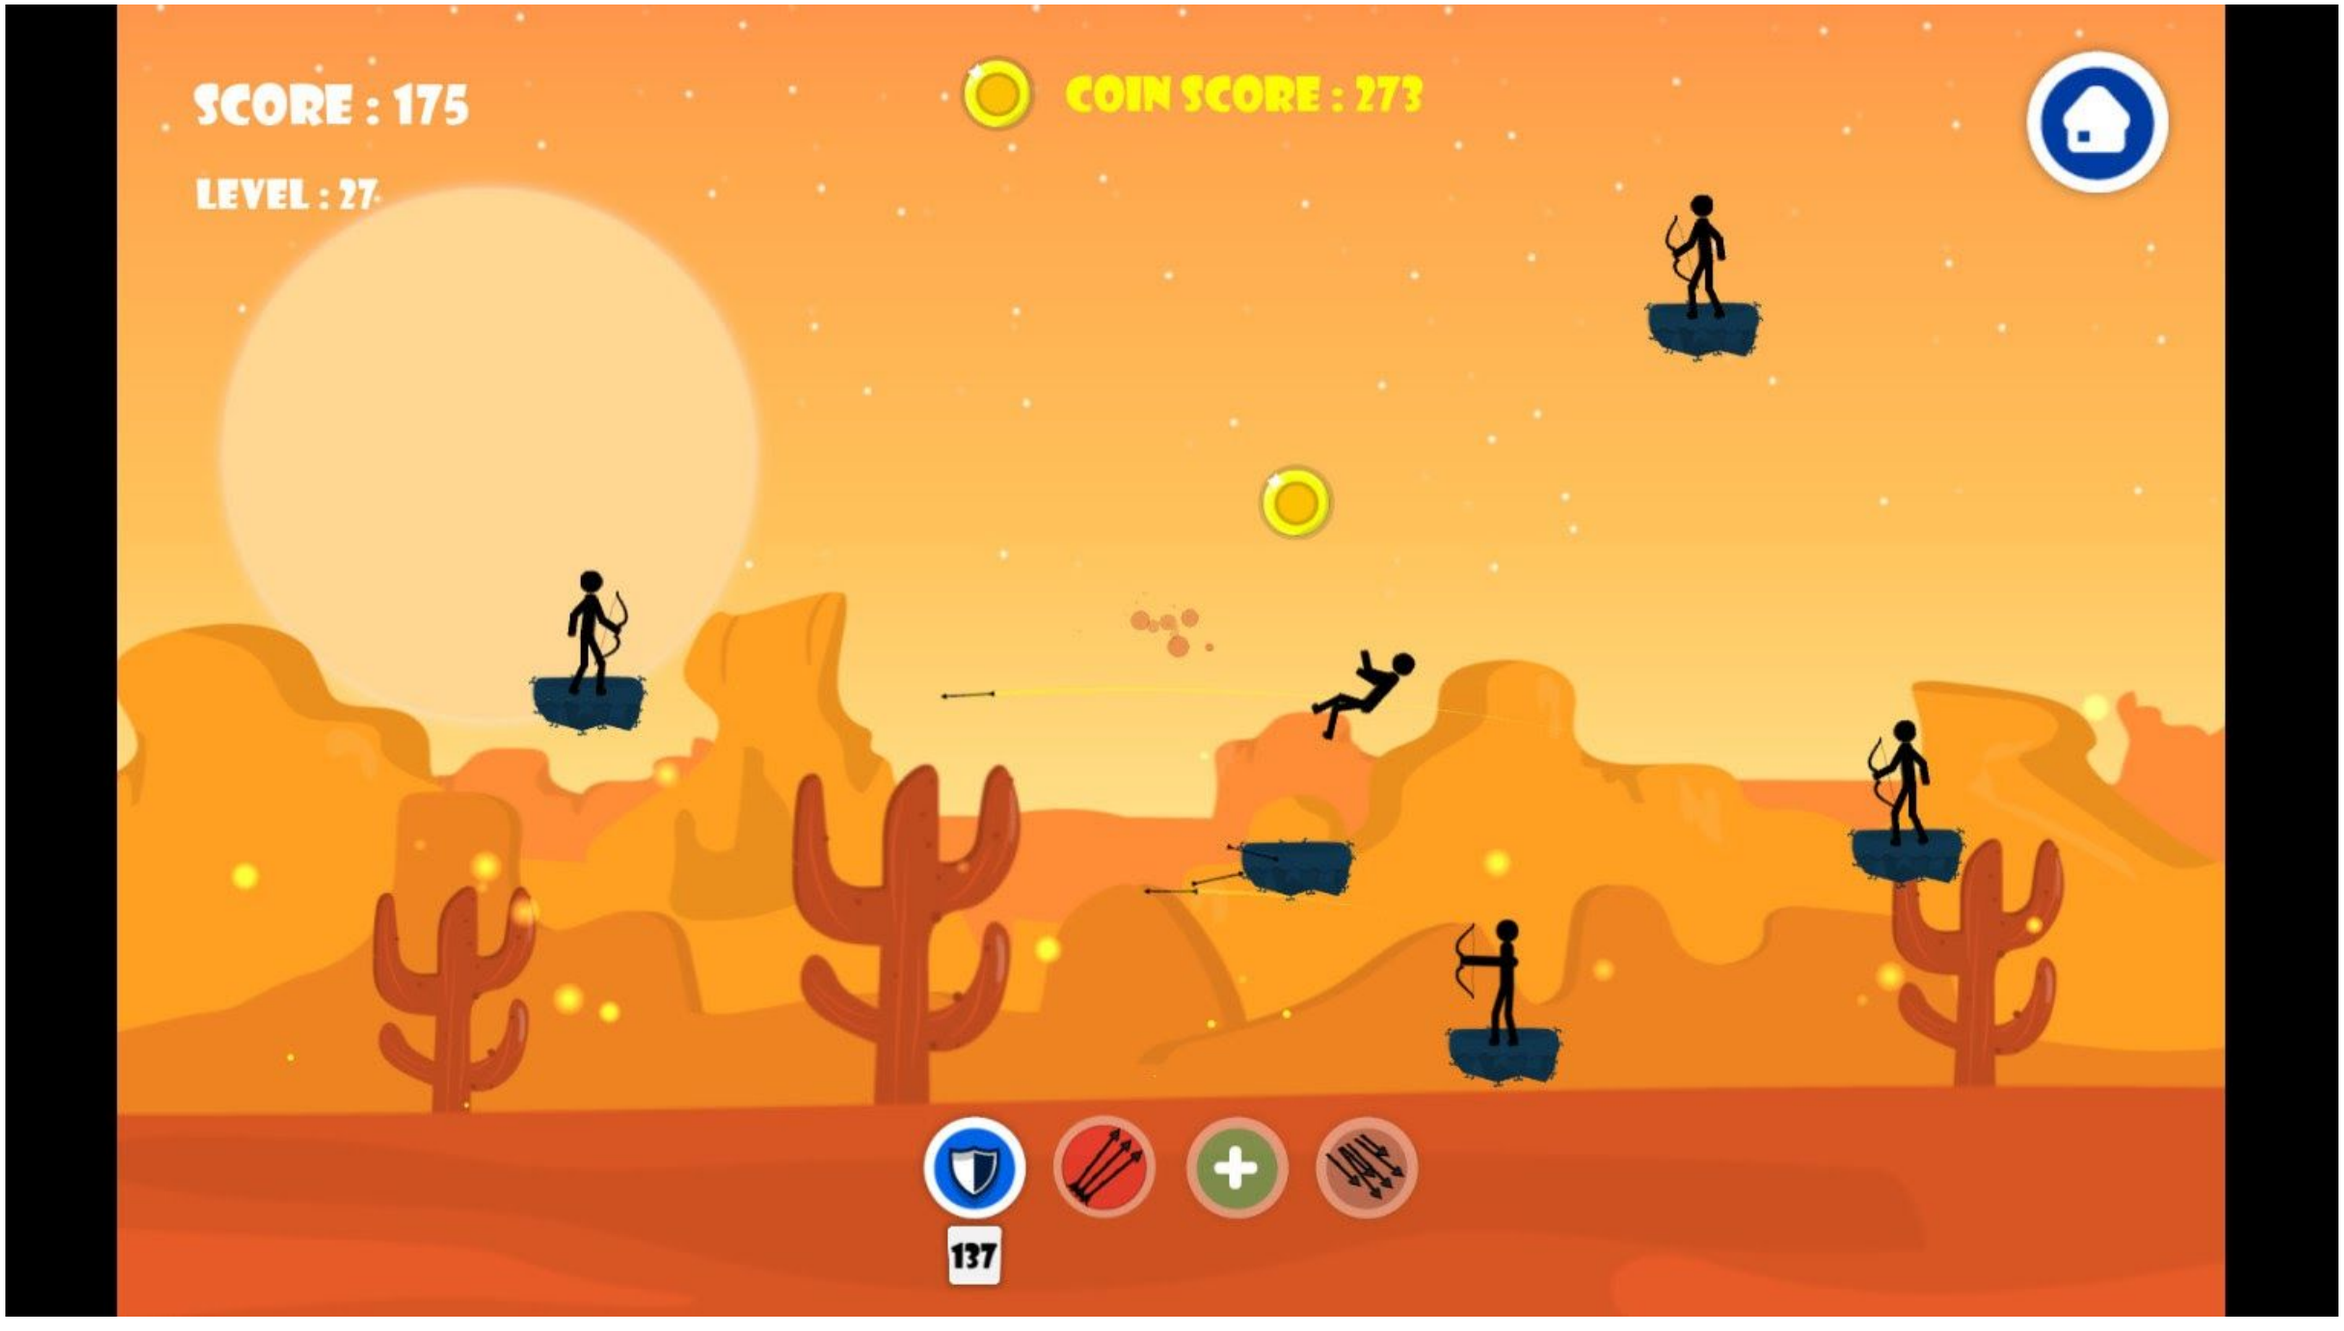

Build Settings

Open build settings and make sure you have added all scenes to it.

How to Play

This game is in the style of action and you have to destroy the enemies with a bow and arrow, the levels of this game are unlimited.
You can buy from the shop by getting coins from killing enemies.

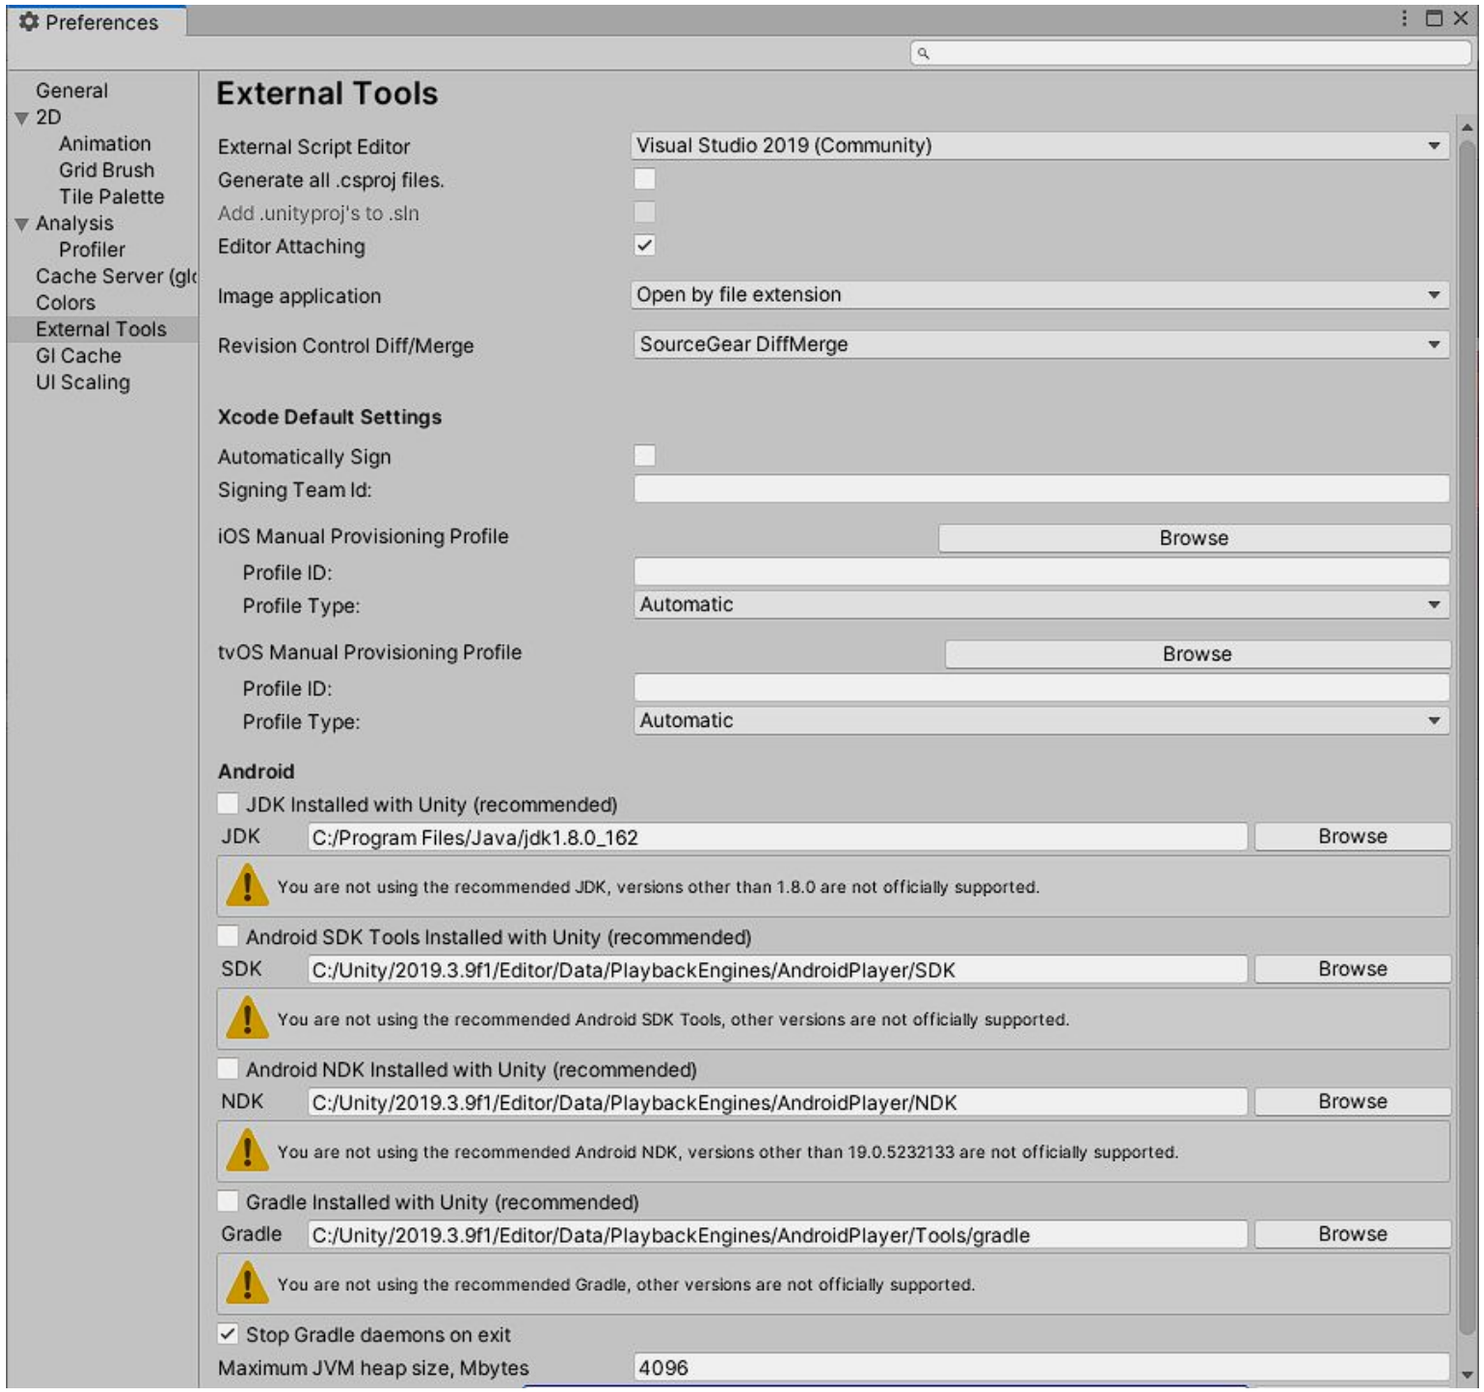

How to Export

Prerequisites

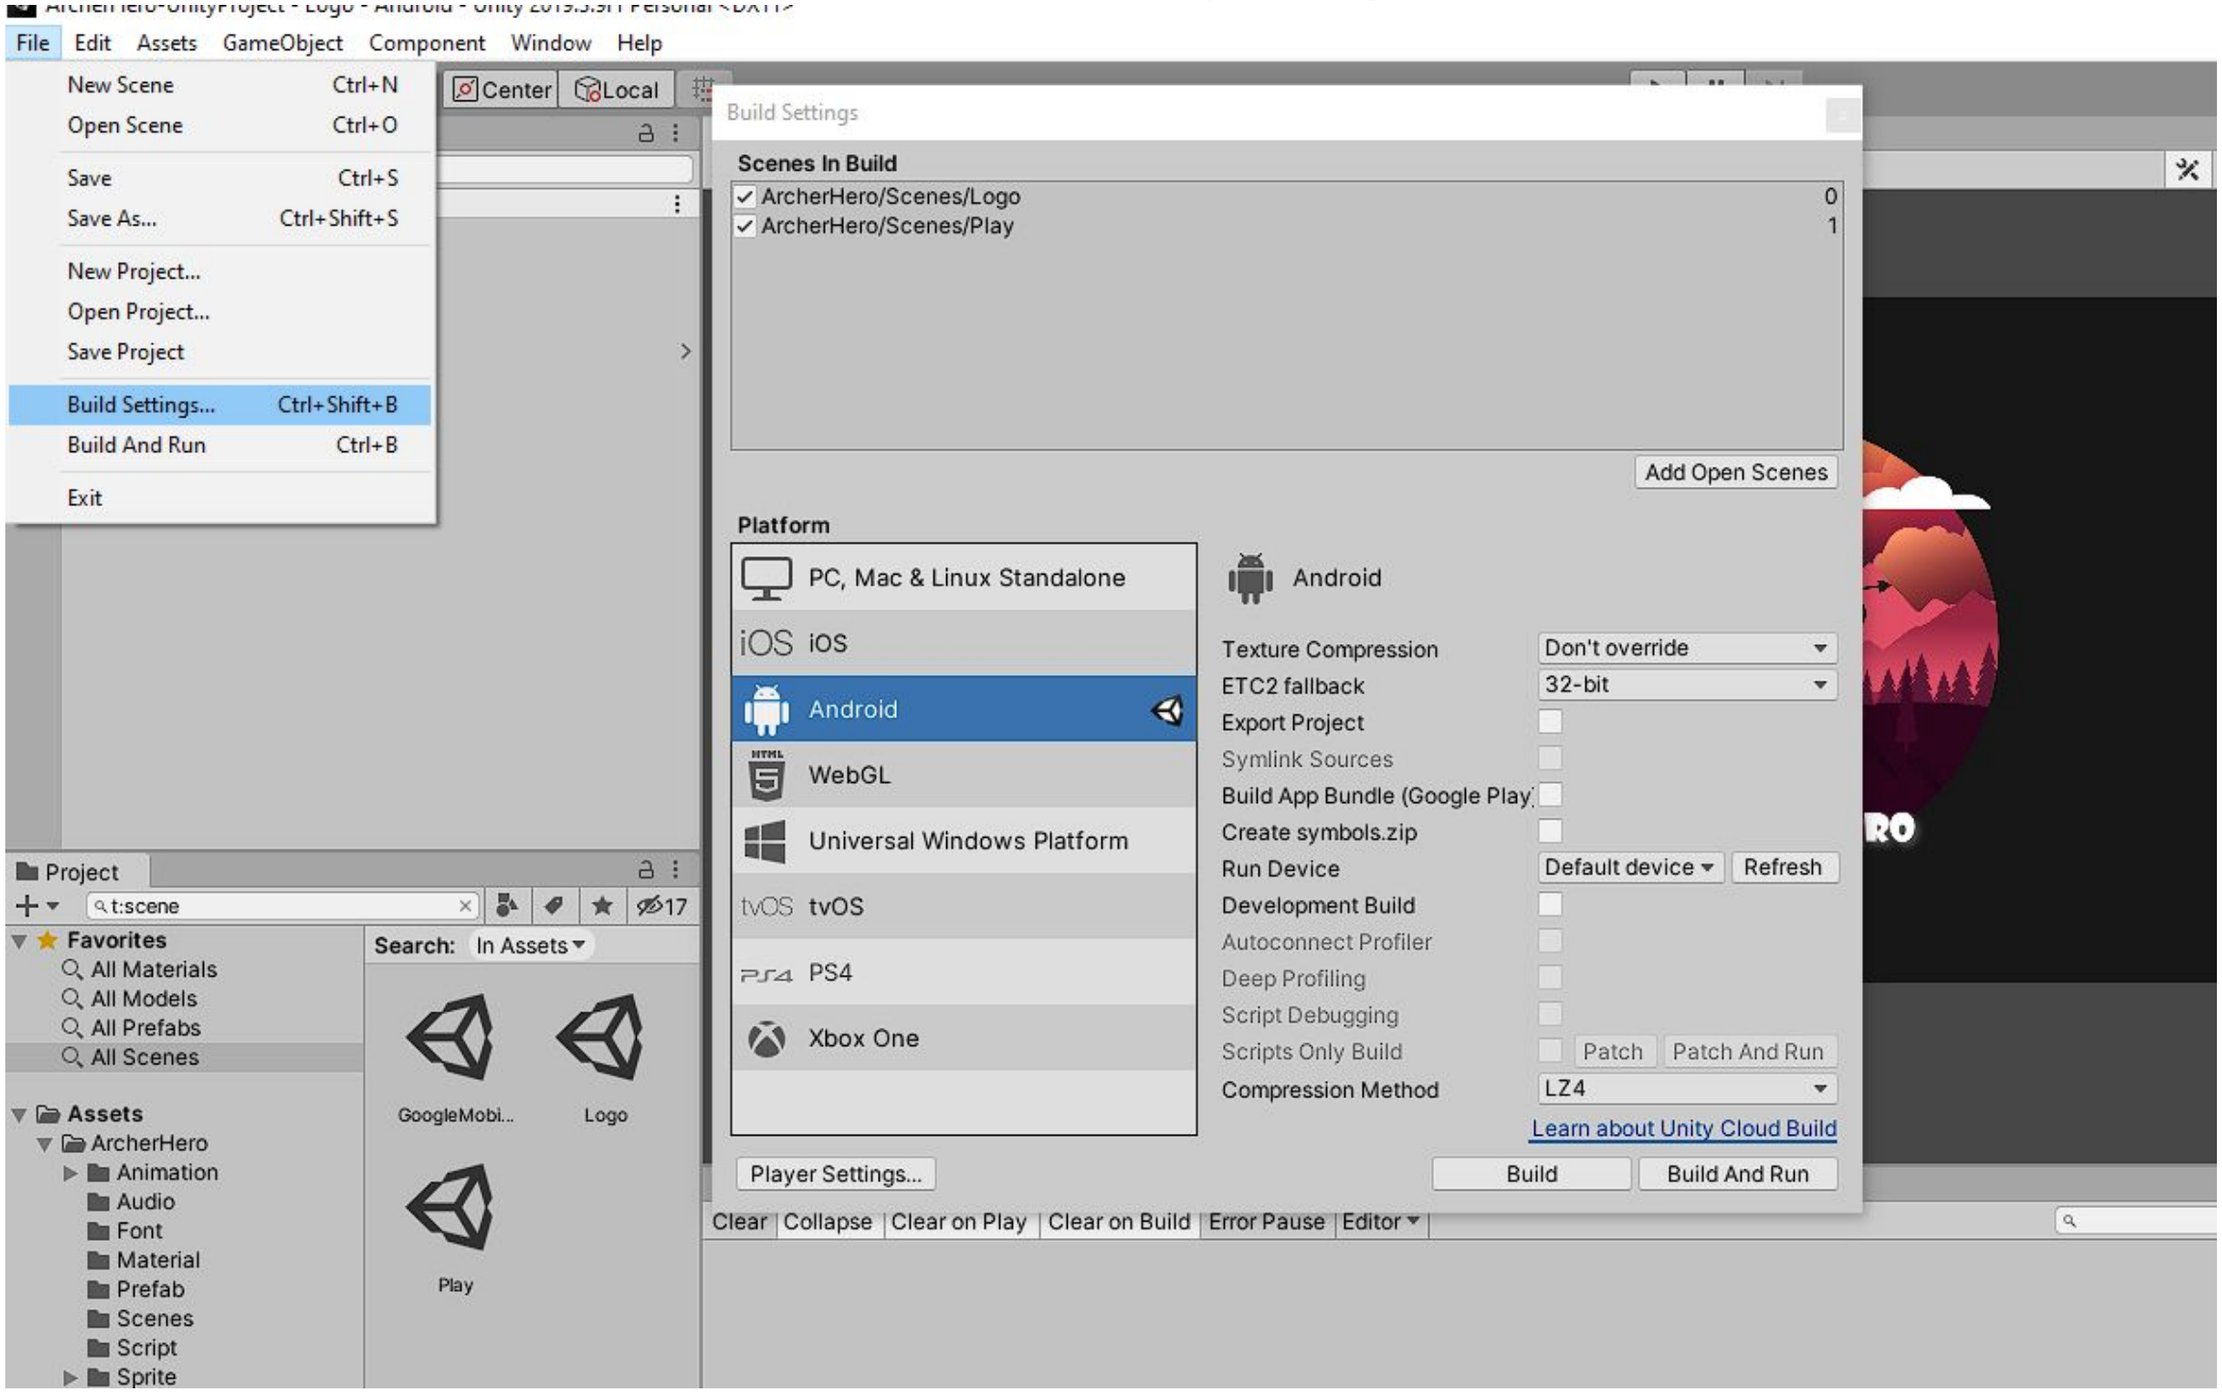

Android and Java SDK

Like the image, click on Preferences from the Edit menu in Unity so that Unity Preferences window is shown and then enter the installation folder address of Android SDK, Java SDK and NDK (ARM64) in their places (you need to have Android SDK and Java SDK installed on your system beforehand).

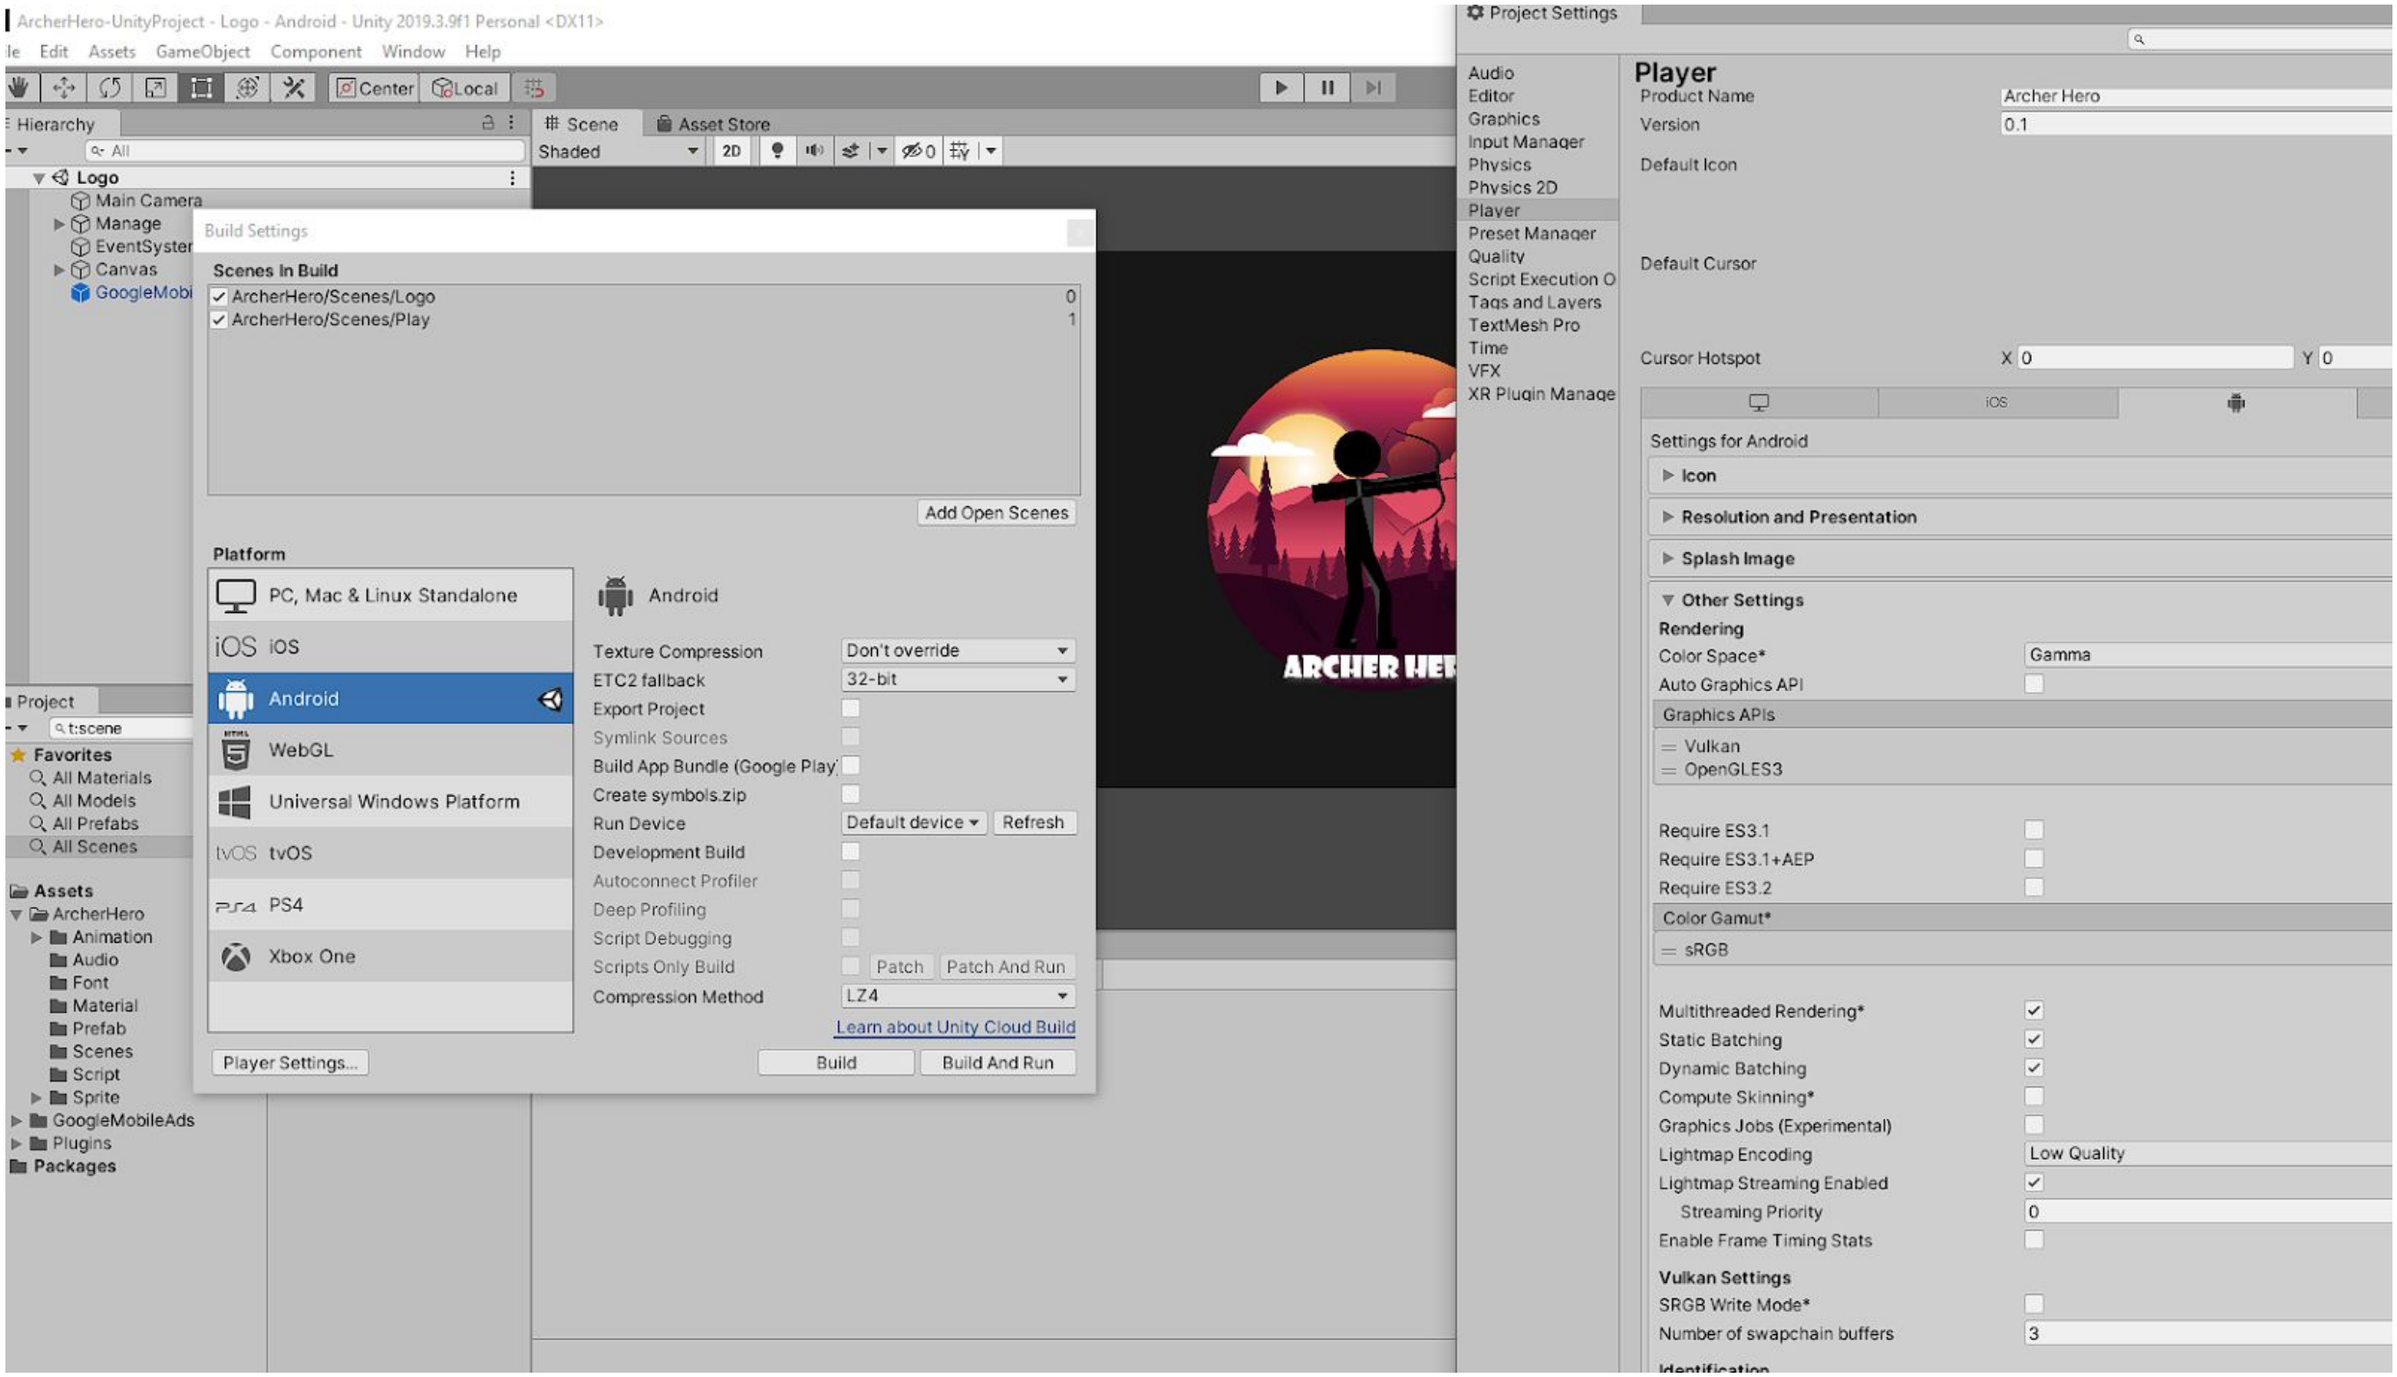

Export to Android

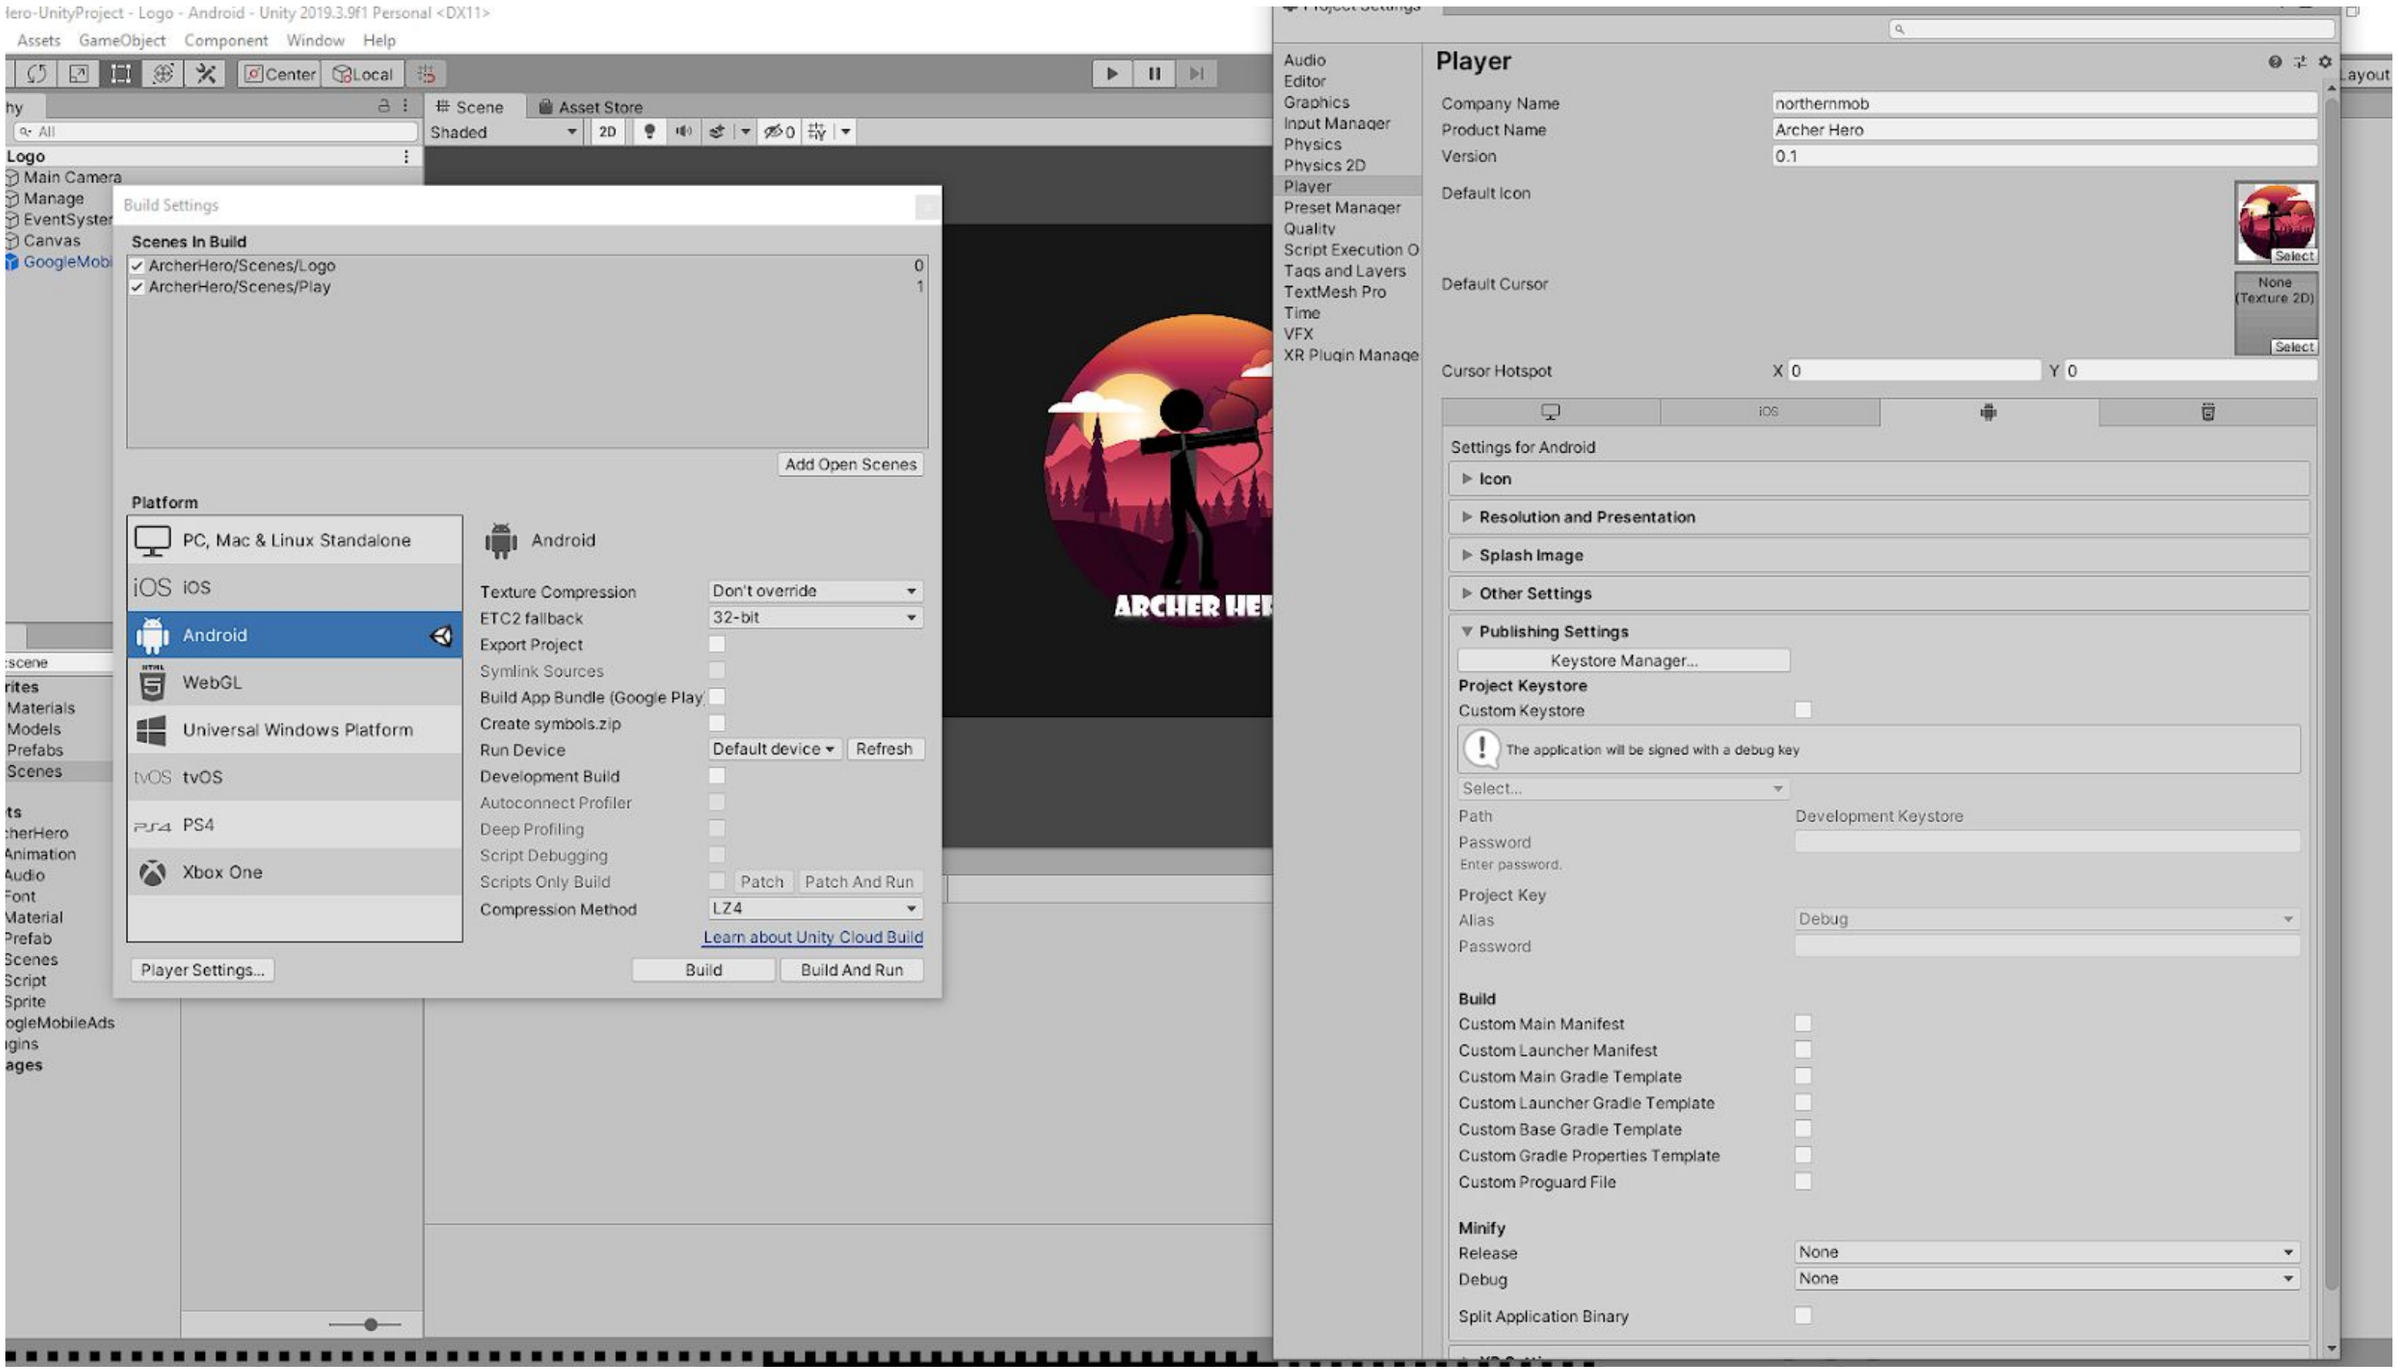

After the project is opened, click on Build Settings in the File menu like the image below.
Then in the newly opened window, click on Android platform and then on Player settings.

Then like the image below, select the desired name for the game and its package name in the Inspector section (if you like).

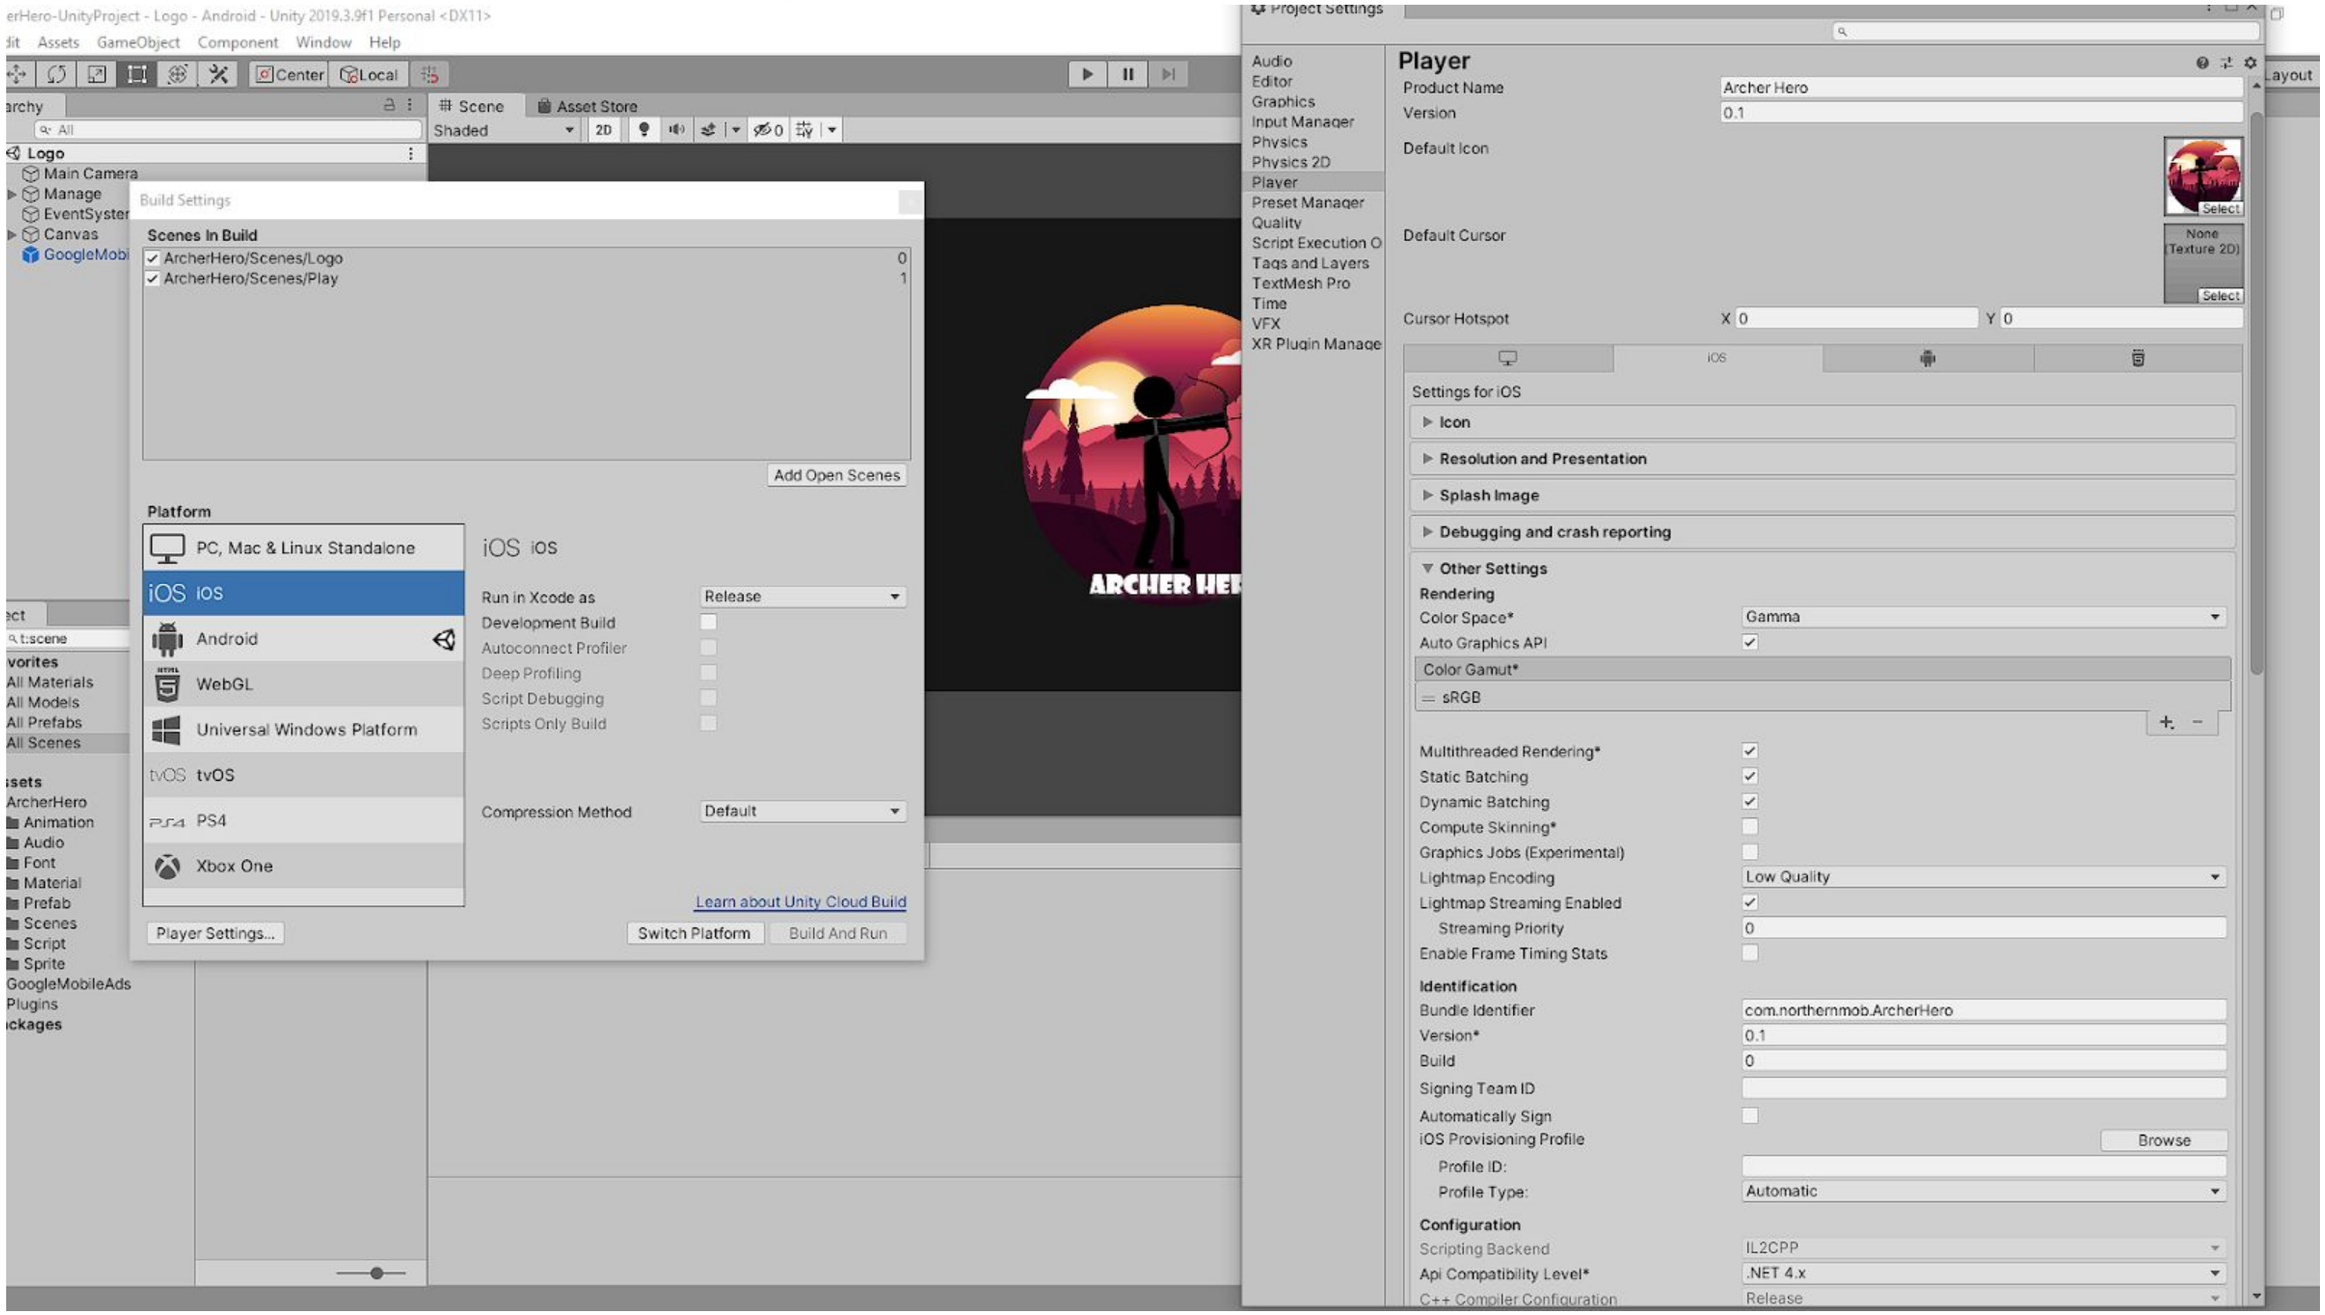

And finally, you have to sign the exported version with your key store like the image below and then click on the Build button so that Unity starts making the exported version for Android.

Here is a guide from Unity website about making Android version:
https://learn.unity.com/tutorial/how-to-publish-to-android

Export to XCode (iOS)

Click on Build Settings from the File menu in Unity.

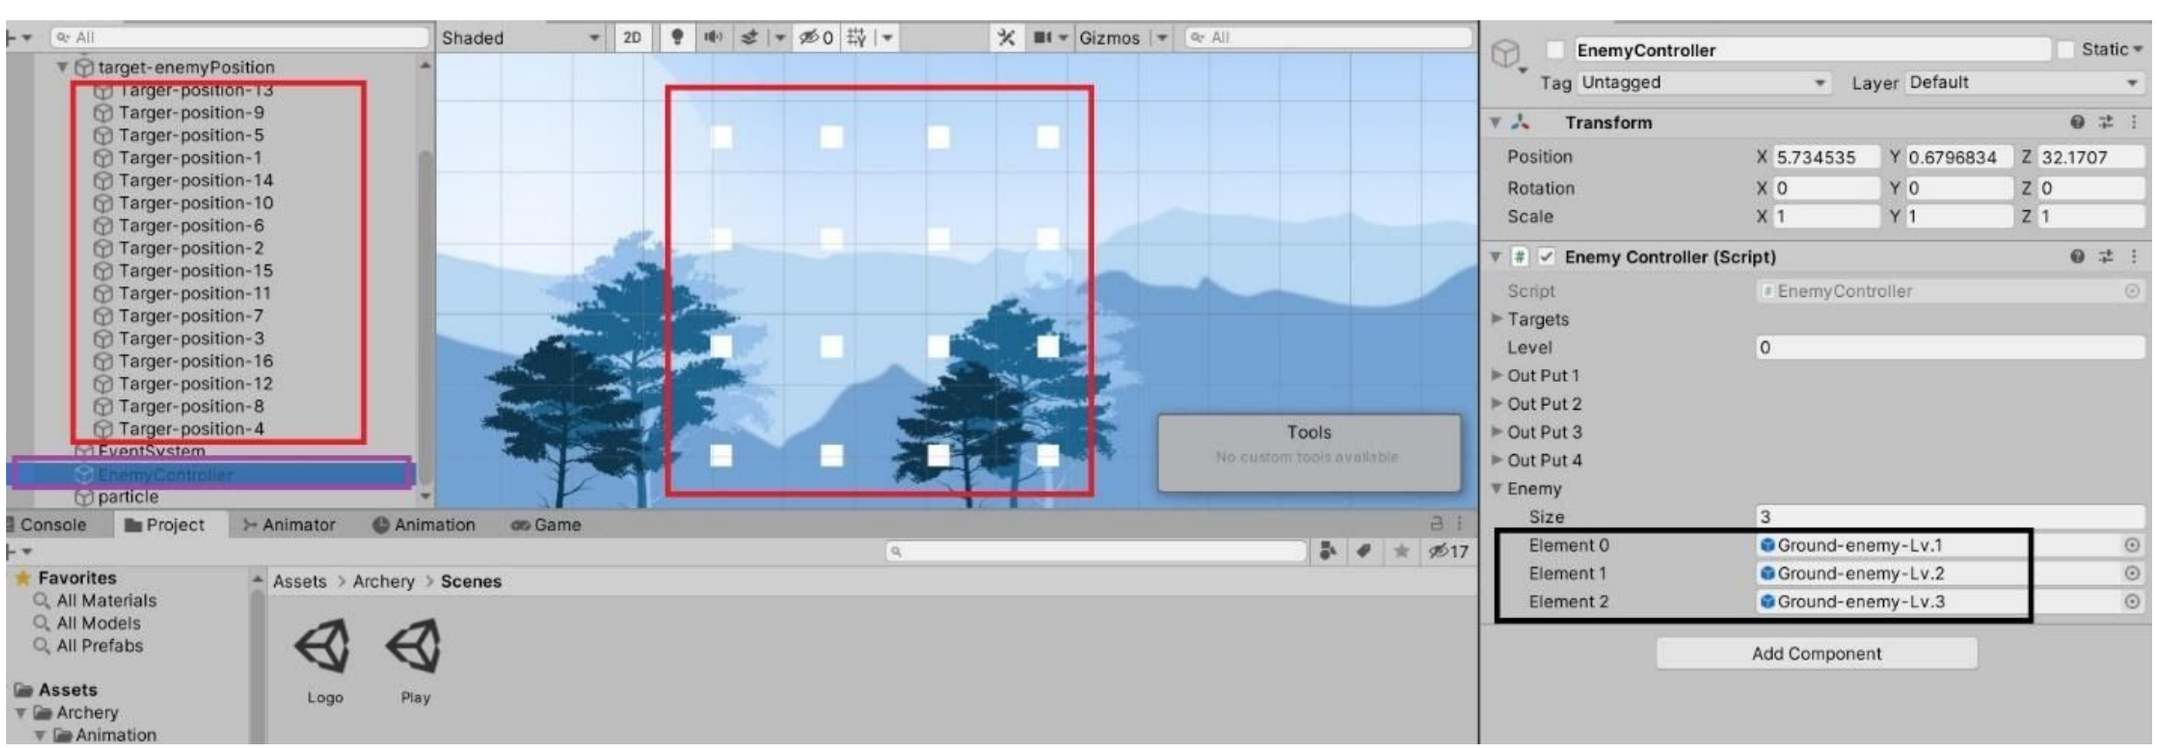

Finally to make the exported version for XCode, click on the Build button in the Build Setting window. And here is a guide for making Android and iOS version from the Unity website that you can read to get some extra details and information:
https://learn.unity.com/tutorial/building-for-mobile

How to Create a New Level

Create a new prefab number in the Prefab folder as shown below."Assets/ FightTheBow/ Prefab "

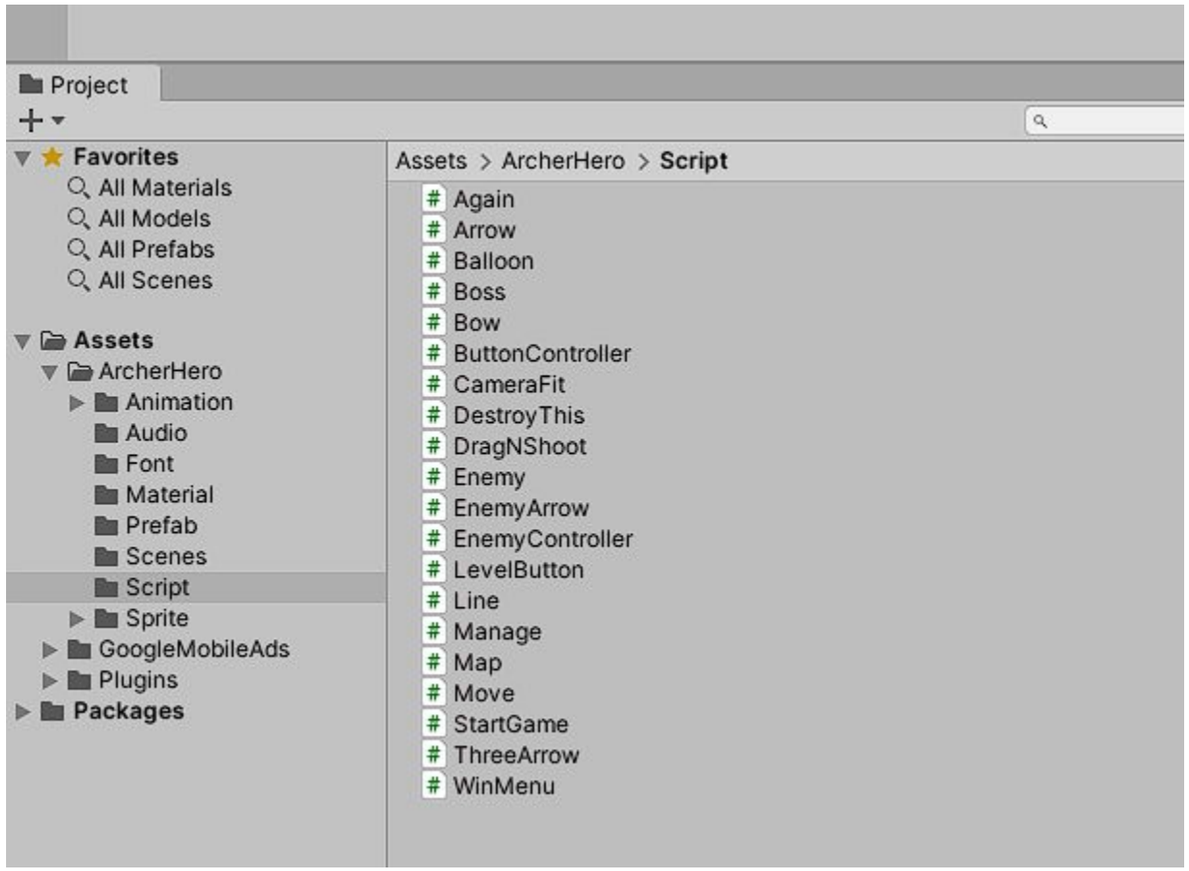

You can create new enemies and change the game to your liking.

In the Play Scene, in the EnemyController code, with the help of the int level, enemies are created in order. In this code, there are three enemies that are created according to the int level. The game will continue until the player is eliminated and bool Lose is not activated in Manage.
The location of the enemies in the targets that you see in the figure above is random.

Scripts

All scripts are under the Scripts folder.

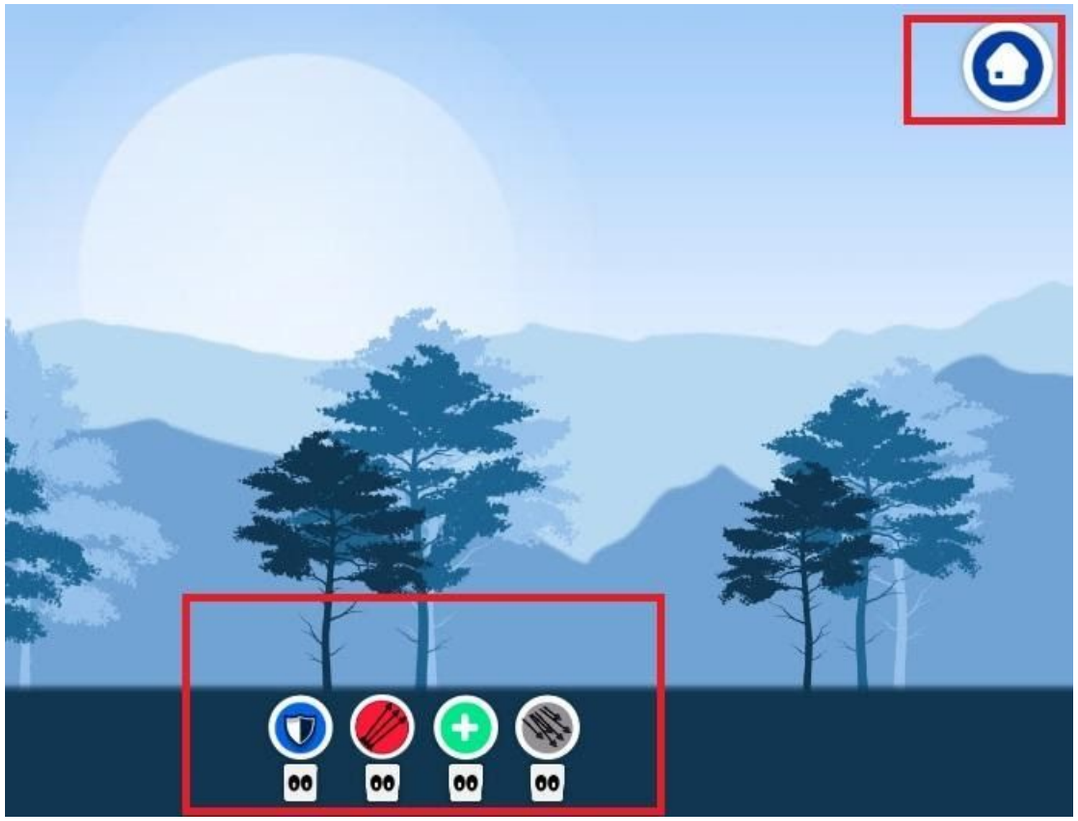

Again.cs
This code is responsible for controlling the end menu of the game, which includes the display of points.

Arrow.cs
This code is for controlling the player's arrow, which includes movement, jumping and collisions.

Bow.cs
This code is responsible for controlling the player's bow, which includes rotating it and creating red points in front of the bow.

ButtonController.cs
This code is responsible for controlling the game buttons.

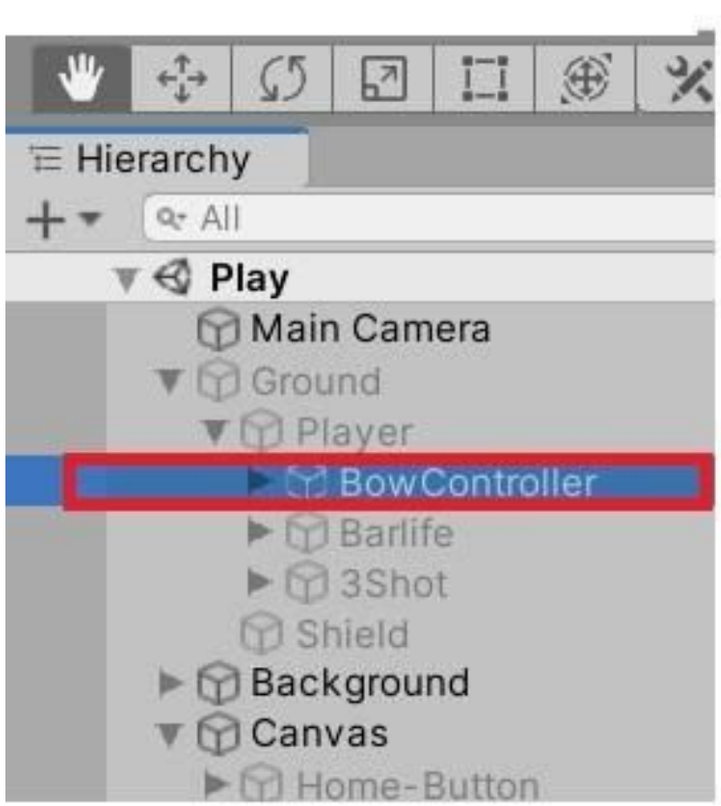

CameraFit.cs
This code is responsible for controlling the size of the camera.

DestroyThis.cs
This code is responsible for destroying the object.

DragNShoot.cs
This code is for controlling the player, which includes animations and feeds and shooting commands.
"Barlife" in this code is an object that displays the amount of player's life.

"BowAnim" in this code controls the bow animation.

"HitNumber" in this code changes according to which part of the player it is and the player animation is specified with it.

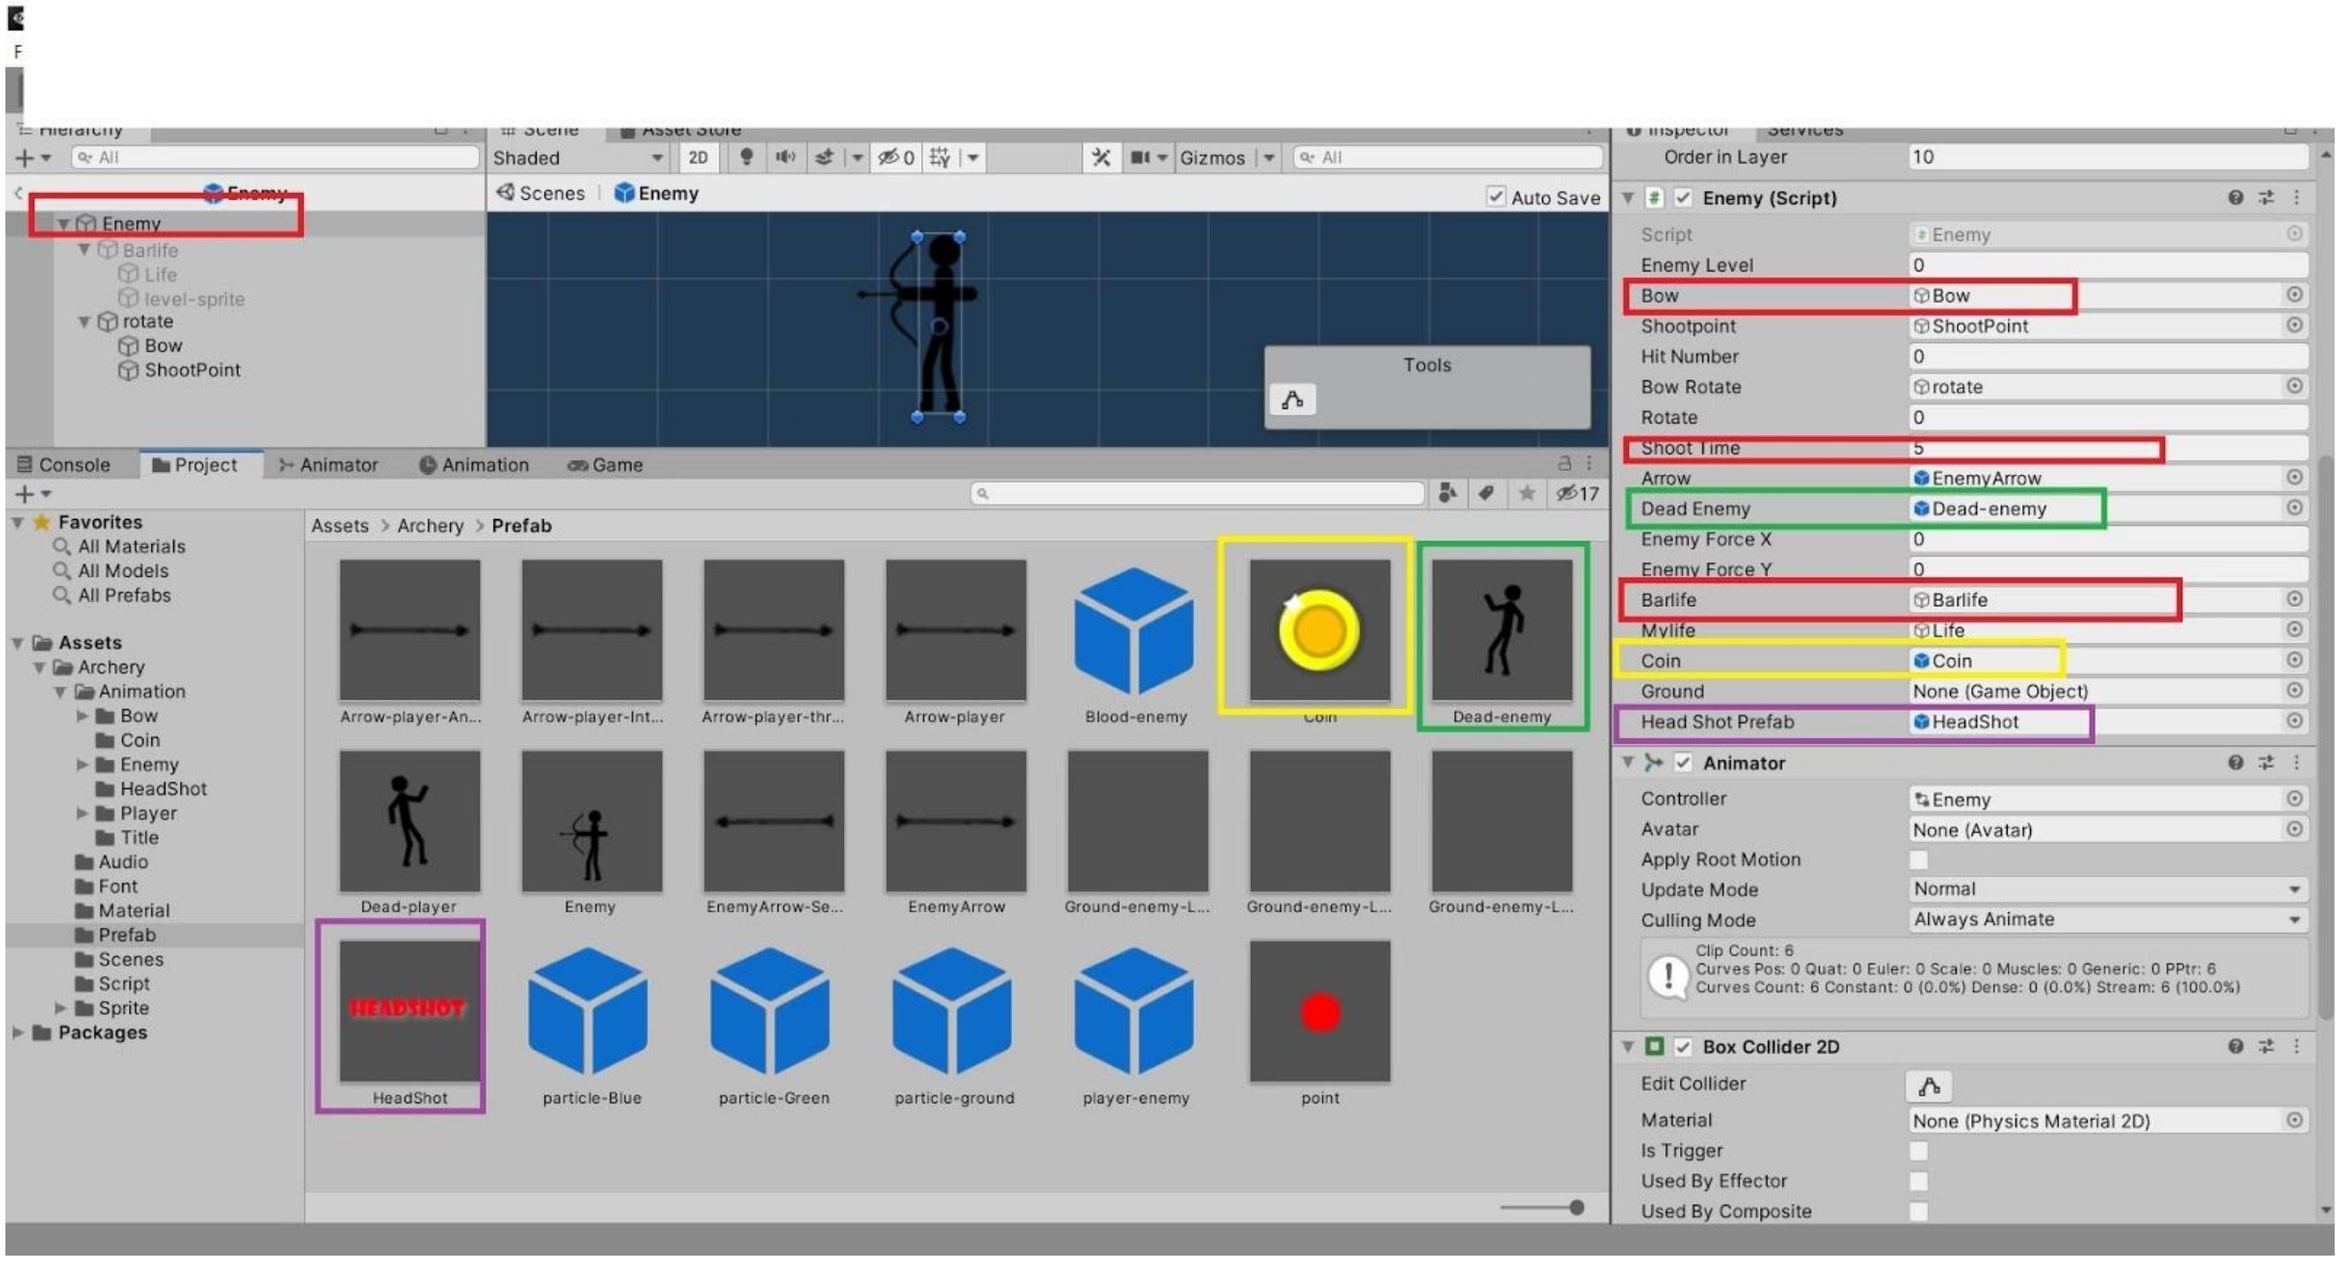

Enemy.cs

This code has the task of controlling enemies, which includes animation and shooting.

This code also has the task of controlling the bow animation and determines the amount of shooting power when firing by accessing the" Manage" code with the help of "EnemyForceX, EnemyForceY".

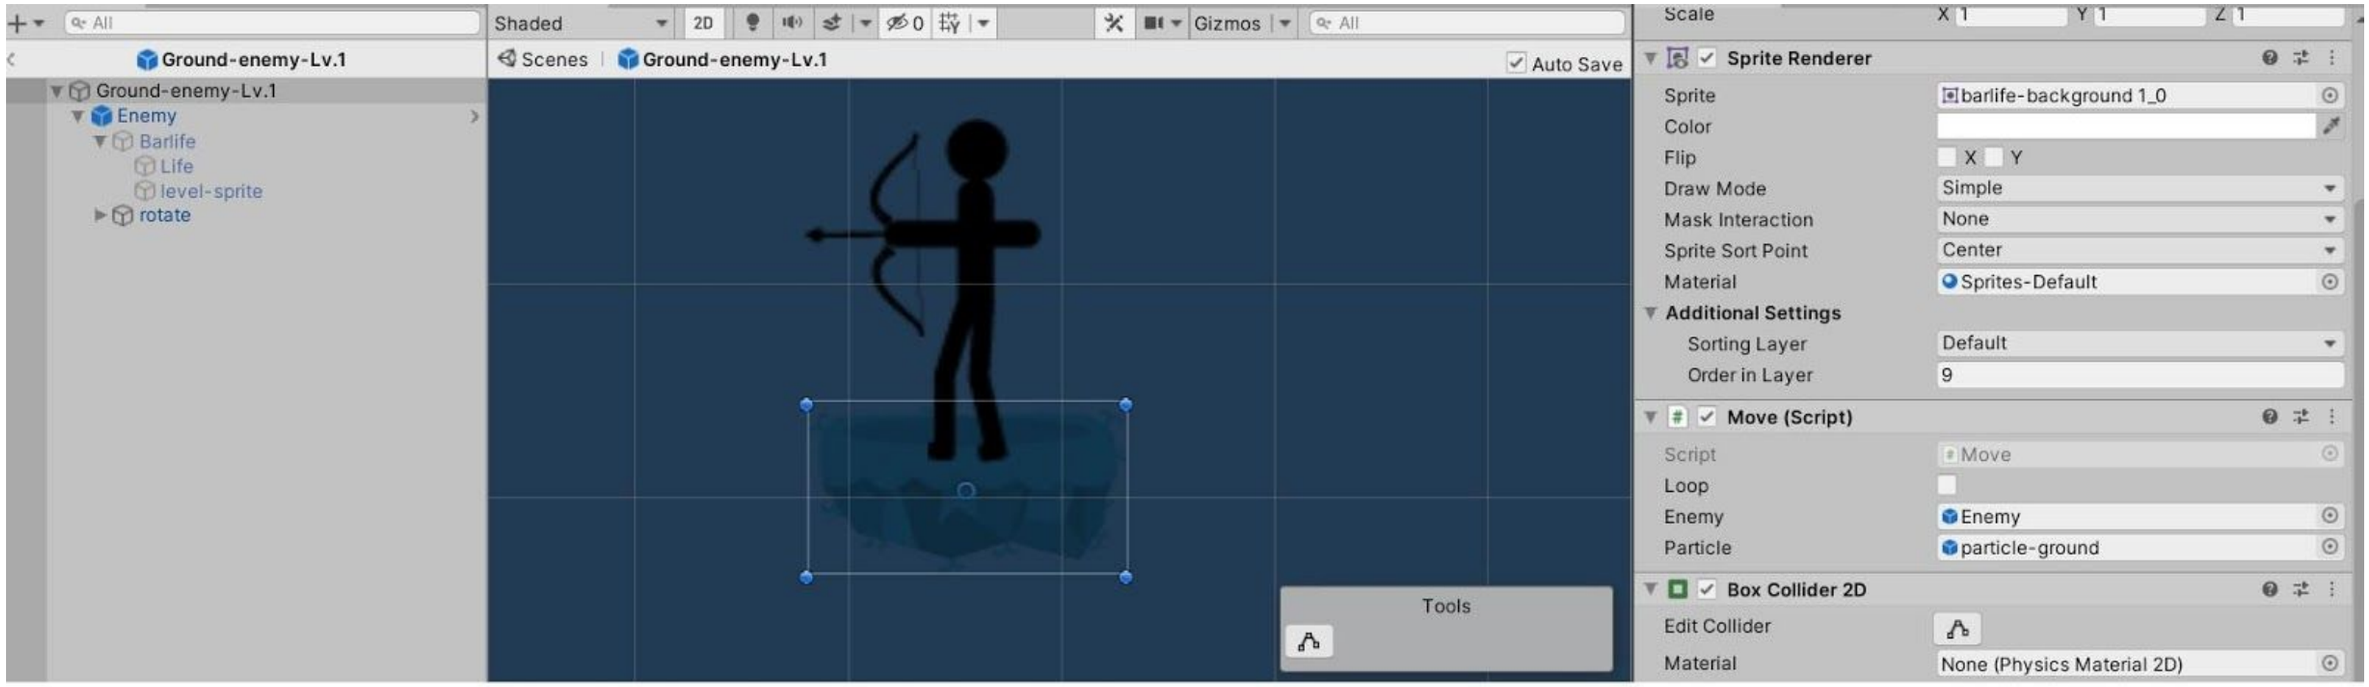

EnemyArrow.cs
This code has the task of controlling enemy arrows.

EnemyController.cs
This code is responsible for controlling the emergence of enemies and makes the game harder with the help of int Level.

Line.cs
This code displays a white line when dragging while shooting.

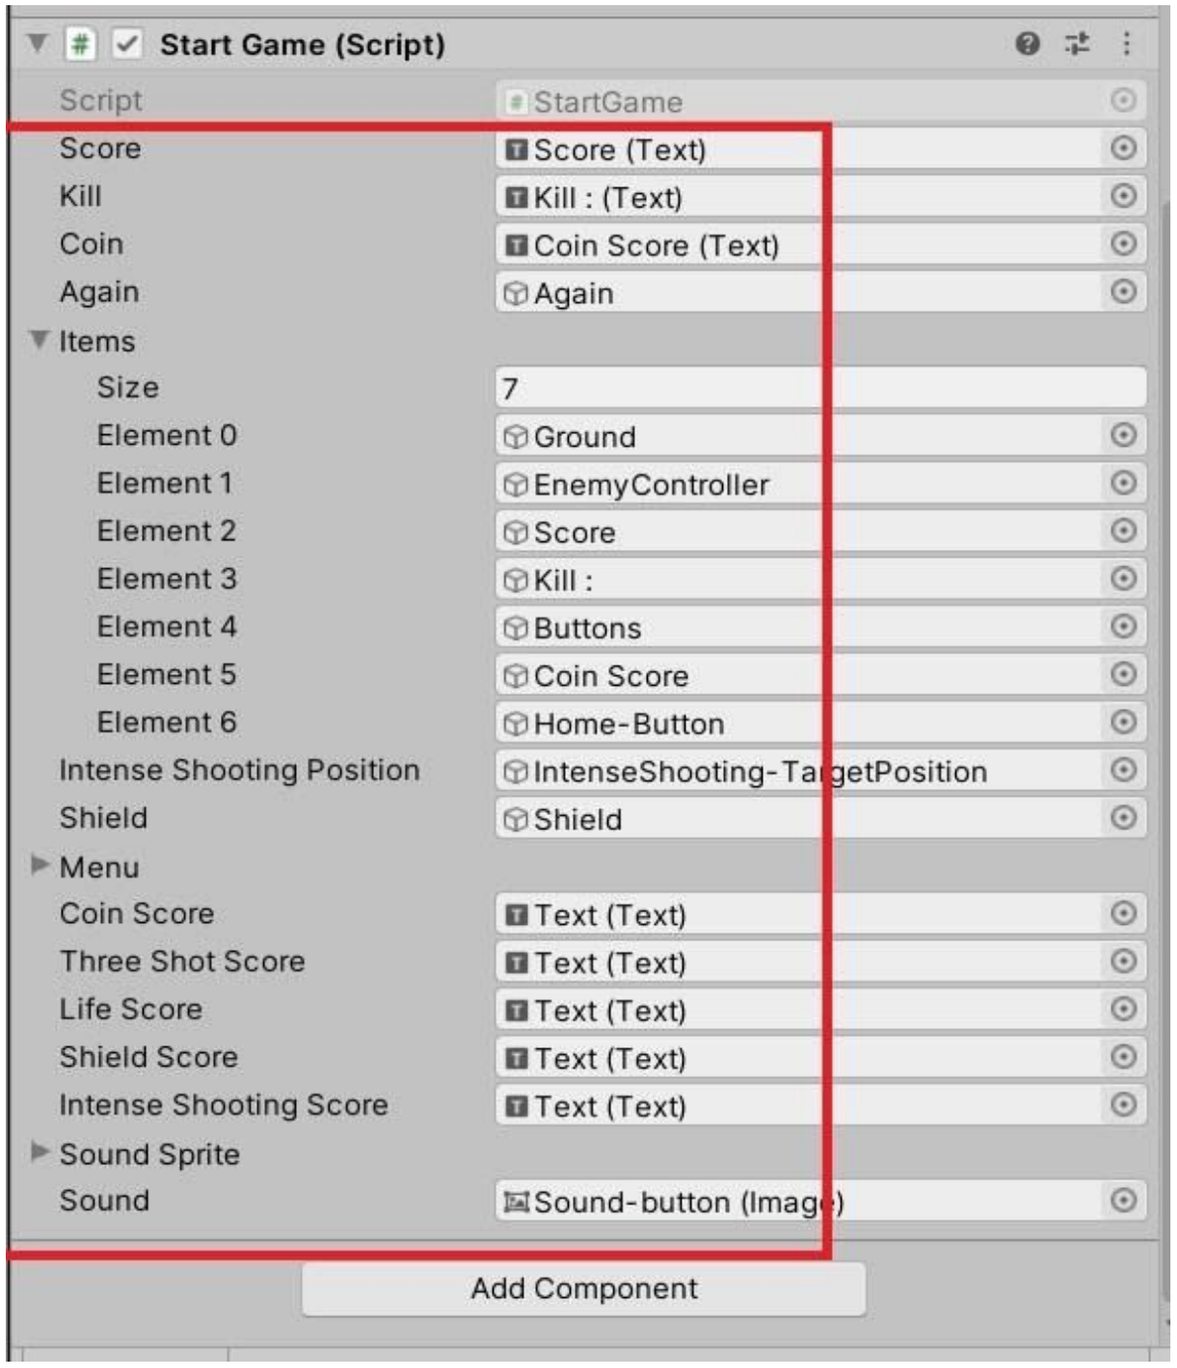

Manage.cs
This code has the task of managing the game, which includes voice control and loss, and the power of throwing arrows and points.

Move.cs
This code has the task of enlarging the size of the enemy and if the loop is activated, it moves up and down.

StartGame.cs

This code has the task of starting the game and controlling the start buttons of the game and at the beginning, it provides the desired items to Manage, which includes displaying points.

ThreeArrow.cs
This code is responsible for controlling the arrow when it comes in multiples.

Balloon.cs
This code has the task of controlling the balloons.

Boss.cs
This code has the task of controlling enemies.

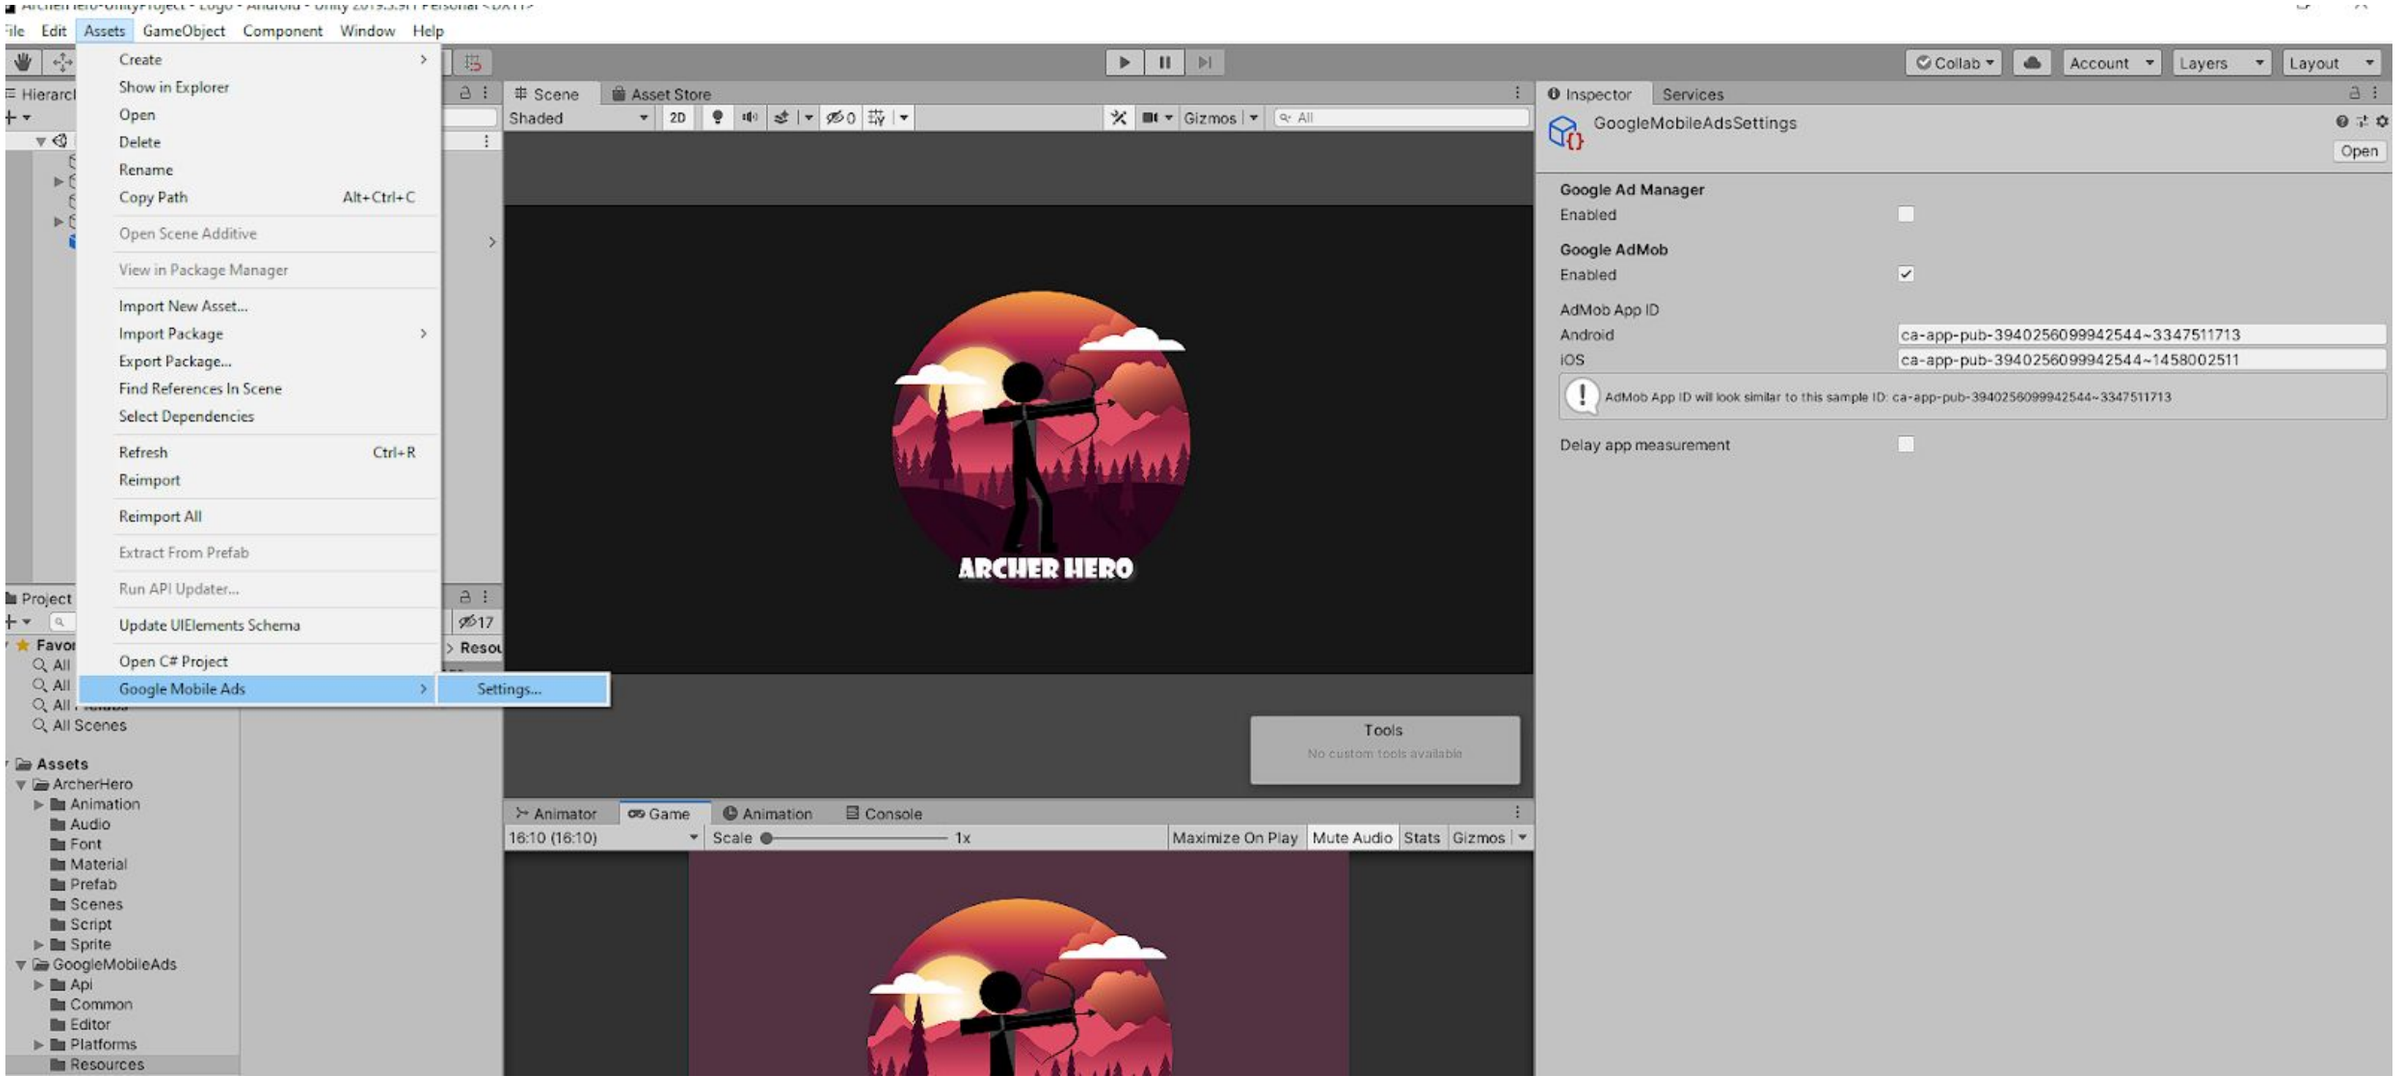

LevelButton.cs
This code has the task of controlling the steps button.

Map.cs
This code has the task of controlling the steps menu.

WinMenu.cs
This code has the task of controlling the victory menu.

Admob

Like the below image, click on settings from assets menu so that Google Mobile Ads configurations are shown up and then enter the App IDs that you have created in your admob panel in Android and iOS sections.

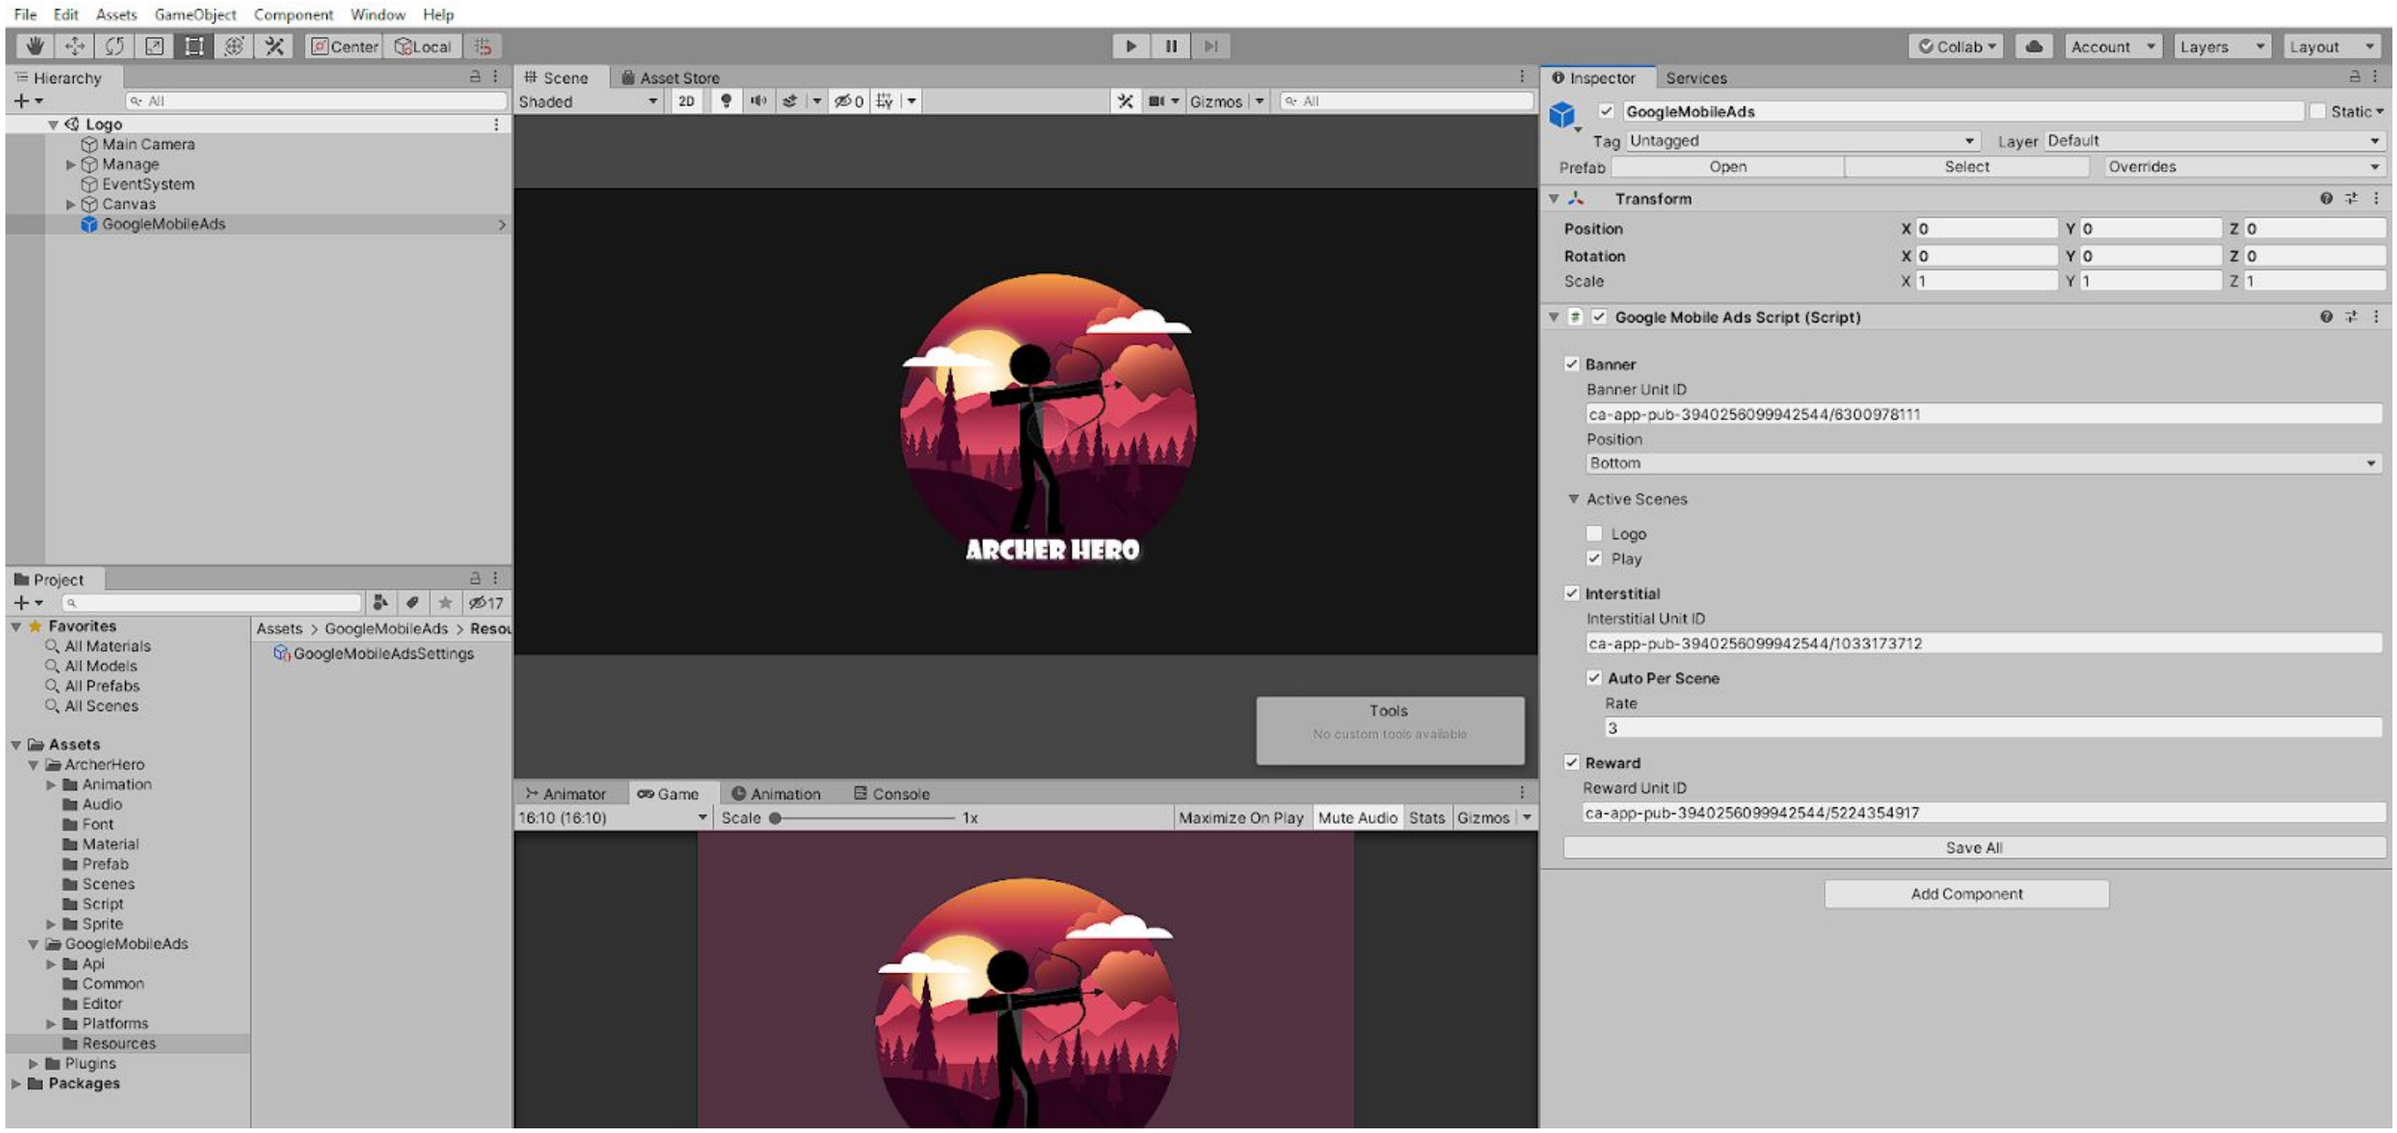

Then in the "Logo" scene, select GoogleMobileAds object and then in inspector, Admob settings are shown. If you want to use banners, you can activate the banner section and enter the corresponding unitid. You can also choose the banner’s position and where in the game it is shown.

To activate full screen ads, you have to mark interstitial choice and enter the related unit id in it like the below image. If you activate Auto per scene, ads will be shown based on the number entered in the Rate field when scenes are changing and you don't have to load the ads manually.

If you want to use reward ads, then you need to activate the Reward section and enter its unit id.

Note: After implementing the changes, make sure to press the Save All button to save your changes.

To show the ads manually, use these codes:

Showing Banner ads:

GoogleMobileAdsScript.USE.ShowBanner();

Removing and not showing banner ads:

GoogleMobileAdsScript.USE.HideBanner();

Showing full screen ads:
GoogleMobileAdsScript.USE.ShowInterstitial();

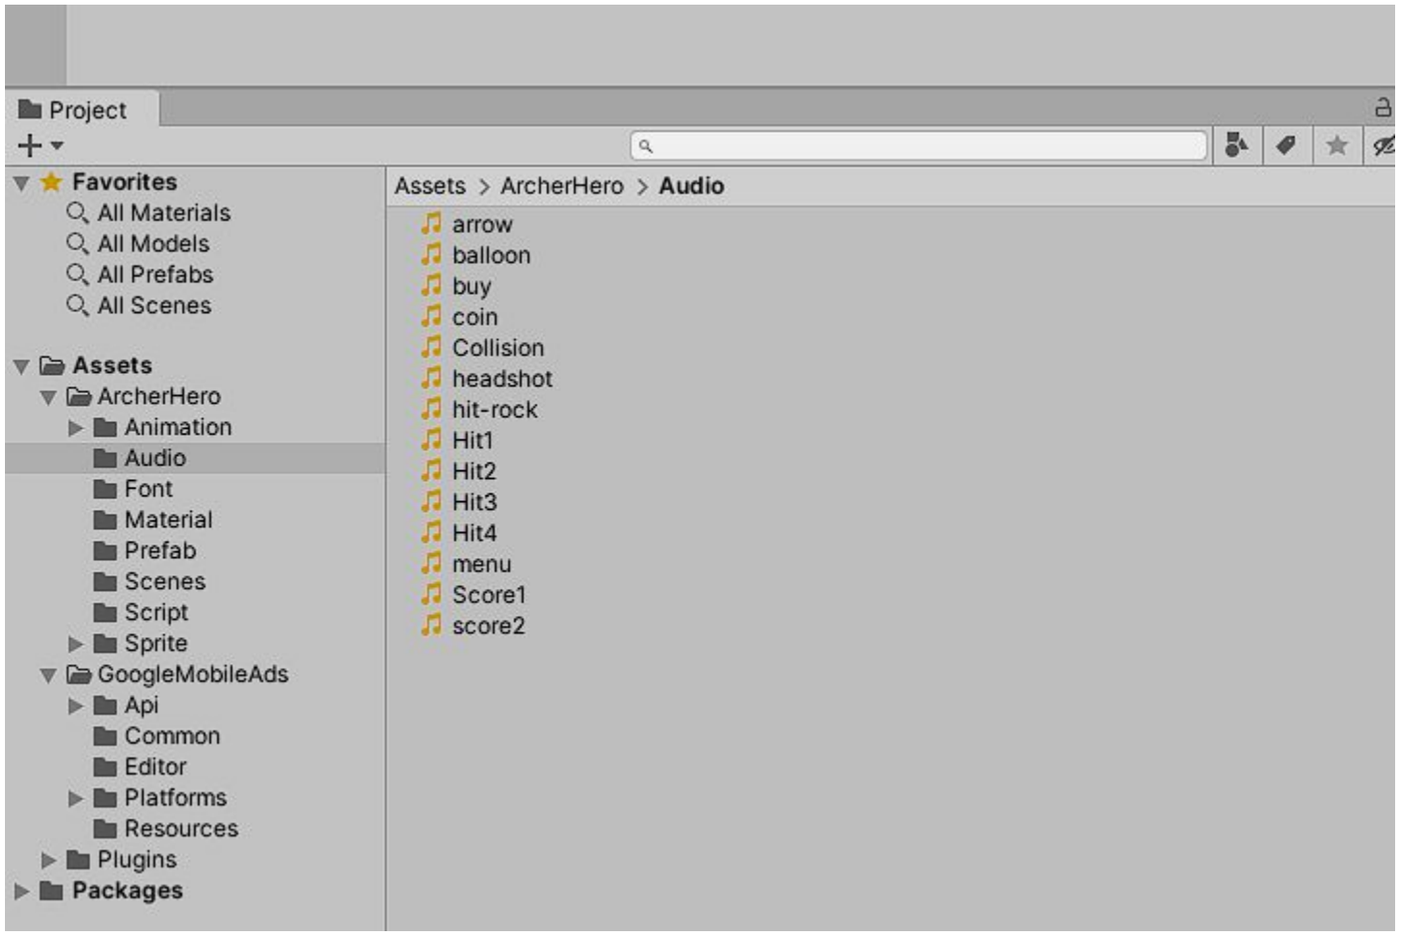

Showing reward ads:
GoogleMobileAdsScript.USE.ShowRewardAd();

Rewarding the player after reward ads is shown successfully:
For this, you need to edit line 73 of GoogleMobileAdsScript like below:

```
1 reference
71  public void RewardVideo(string type, double amount)
72  {
73      // put ur rewarded video here
74
75  }
```

Music and Sfx

To change the game's sounds and music, you have to replace the sounds in the Audio folder with what you want. But note that you must keep the files names exactly as before.

Reskin

All of the images that are used in the game are in the Sprite folder. You can replace the default images with the new ones that you want.

Important Note: For changing the game's default images, new images should have the same size and name as default ones
